[001] The present application claims priority of U.S. Provisional Application No. 60/255,145, filed December 14, 2000, and of French Patent Application No. FR 00 14738, filed November 15, 2000, all of which are specifically incorporated by reference herein.

[002] The present invention relates to heterocyclalkyl-piperidine derivatives of general formula:

[003]

[004] which are active as antimicrobial agents. The invention also relates to their preparation and to compositions containing them.

[005] Patent applications WO 99/37635 and WO 00/43383 disclose antimicrobial quinolypropylpiperidine derivatives of general formula:

[006]

[007] in which the radical  $R_1$  is especially (C1-6) alkoxy,  $R_2$  is hydrogen,  $R_3$  is in position -2 or -3 and

represents (C1-6) alkyl which may optionally be substituted with from 1 to 3 substituents chosen from thiol, halogen, alkylthio, trifluoromethyl, carboxyl, alkyloxycarbonyl, alkylcarbonyl, alkenyloxycarbonyl, alkenylcarbonyl, hydroxyl optionally substituted with alkyl, etc.,  $R_4$  is a group  $-CH_2-R_5$  for which  $R_5$  is selected from alkyl, hydroxyalkyl, alkenyl, alkynyl, tetrahydrofuryl, optionally substituted phenylalkyl, optionally substituted phenylalkenyl, optionally substituted heteroarylalkyl, optionally substituted heteroaryl, etc.,  $n$  is 0 to 2,  $m$  is 1 or 2 and  $A$  and  $B$  are especially oxygen, sulfur, sulfinyl, sulfonyl,  $NR_{11}$ ,  $CR_6R_7$  for which  $R_6$  and  $R_7$  represent H, thiol, alkylthio, halo, trifluoromethyl, alkenyl, alkenylcarbonyl, hydroxyl, amino, and  $Z_1$  to  $Z_5$  are N or  $CR_{1a}$ , etc.

[008]        These products show antimicrobial activity. However, no derivative disubstituted in position -4 of the piperidine had been synthesized hitherto and consequently no biological activity had been discovered for such products either.

[009]        Since slight modifications to the structures already known can result in large variations in activity, it was not obvious that derivatives disubstituted in position -4 of the piperidine would also have antibacterial activity.

[010] European patent application EP 30044 discloses quinoline derivatives which are useful as cardiovascular agents, corresponding to the general formula:

[011] in which  $R_1$  is especially alkyloxy, A-B is  $-CH_2-CH_2-$ ,  $-CHOH-CH_2-$ ,  $-CH_2-CHOH-$ ,  $-CH_2-CO-$  or  $-CO-CH_2-$ ,  $R_1$  is H, OH or alkyloxy,  $R_2$  is ethyl or vinyl,  $R_3$  is especially alkyl, hydroxyalkyl, cycloalkyl, hydroxyl, alkenyl, alkynyl, tetrahydrofuryl, phenylalkyl, optionally substituted diphenylalkyl, optionally substituted phenylalkenyl, optionally substituted benzoyl or benzoylalkyl, optionally substituted heteroaryl or heteroarylalkyl, and Z is H or alkyl or forms with  $R_3$  a cycloalkyl radical.

[012] It has now been found, and this forms the subject of the present invention, that the products of general formula (I) for which:

[013]  $X_1, X_2, X_3, X_4$  and  $X_5$  represent, respectively,  $>C-R'_1$  to  $>C-R'_5$ , or alternatively not more than one of them represents a nitrogen atom,

[014]  $R_1, R'_1, R'_2, R'_3, R'_4$  and  $R'_5$  are identical or different and represent a hydrogen or halogen atom or an

alkyl, cycloalkyl, phenyl, phenylthio, mono- or bicyclic aromatic heterocyclyl or heterocyclylthio, hydroxyl, alkyloxy, trifluoromethoxy, alkylthio, trifluoromethylthio, cycloalkyloxy, cycloalkylthio, cyano, carboxyl, alkyloxycarbonyl, cycloalkyloxycarbonyl, -NRaRb or -CONRaRb radical (for which Ra and Rb can represent hydrogen, alkyl, cycloalkyl, phenyl, mono- or bicyclic aromatic heterocyclyl or Ra and Rb form, together with the nitrogen atom to which they are attached, a 5- or 6-membered heterocycle which can optionally contain another heteroatom chosen from O, S, and N and, where appropriate, bearing an alkyl, phenyl or mono- or bicyclic aromatic heterocyclyl substituent on the nitrogen atom or, where appropriate, the sulfur atom of which is oxidized in the form of sulfinyl or sulfonyl), or represent a methylene radical substituted with fluoro, hydroxyl, alkyloxy, alkylthio, cycloalkyloxy, cycloalkylthio, phenyl, mono- or bicyclic aromatic heterocyclyl, carboxyl, alkyloxycarbonyl, cycloalkyloxycarbonyl, -NRaRb or -CONRaRb for which Ra and Rb are defined as above, or represent phenoxy, heterocycliloxy, benzyloxy, heterocyclylmethoxy, or alternatively R<sub>1</sub> can also represent difluoromethoxy, or a radical of structure -C<sub>m</sub>F<sub>2m+1</sub>, -SC<sub>m</sub>F<sub>2m+1</sub> or -OC<sub>m</sub>F<sub>2m+1</sub> for which m is an integer from 1 to 6, or alternatively R'<sub>5</sub> can also represent trifluoroacetyl,

[015]  $R_2$  represents carboxyl, alkyloxycarbonyl, cycloalkyloxycarbonyl, cyano,  $-\text{CONRaRb}$  (for which Ra and Rb represent, respectively, hydrogen, alkyl, cycloalkyl, phenyl, mono- or bicyclic aromatic heterocyclyl, or Ra or Rb represents hydroxyl, alkyloxy, cycloalkyloxy, or Ra and Rb form, together with the nitrogen atom to which they are attached, a 5- or 6-membered heterocycle which can optionally contain another heteroatom chosen from O, S and N and, where appropriate, bearing an alkyl, phenyl or mono- or bicyclic aromatic heterocyclyl substituent on the nitrogen atom or, where appropriate, the sulfur atom of which is oxidized in the form of sulfinyl or sulfonyl), or  $R_2$  represents hydroxymethyl, alkyl containing 1 or 2 carbon atoms substituted with carboxyl, alkyloxycarbonyl, cycloalkyloxycarbonyl, cyano or  $-\text{CONRaRb}$  for which Ra and Rb are defined as above, or  $R_2$  represents a radical of structure  $-\text{CF}_2-\text{Rc}$ ,  $-\text{C}(\text{CH}_3)_2-\text{Rc}$ ,  $-\text{CO}-\text{Rc}$ ,  $-\text{CHOH}-\text{Rc}$ ,  $-\text{C}(\text{cycloalkyl})-\text{Rc}$ , or  $-\text{CH}=\text{CH}-\text{Rc}$  for which Rc is carboxyl, alkyloxycarbonyl, cycloalkyloxycarbonyl, or  $-\text{CONRaRb}$  for which Ra and Rb are defined as above,

[016]  $R_3$  represents a phenyl, mono- or bicyclic aromatic heterocyclyl or  $\text{alk-R}^\circ$ , radical for which alk is an alkyl radical and  $\text{R}^\circ$  represents hydrogen, halogen, hydroxyl, alkyloxy, alkylthio, alkylsulfinyl, alkylsulfonyl, alkylamino, dialkylamino, cycloalkyl, cycloalkyloxy, cycloalkylthio,

cycloalkylsulfinyl, cycloalkylsulfonyl, cycloalkylamino, N-

 mono- or bicyclic aromatic heterocyclyl, heterocyclyoxy,  
 heterocyclylthio, heterocyclylsulfinyl, heterocyclylsulfonyl,  
 heterocyclylamino, N-alkyl-N-heterocyclylamino, N-cycloalkyl-  
 N-heterocyclylamino, heterocyclylcarbonyl,  
 heterocyclylalkyloxy, heterocyclylalkylthio,  
 heterocyclylalkylsulfinyl, heterocyclylalkylsulfonyl,  
 heterocyclylalkylamino, N-alkyl-N-heterocyclylaminoalkyl, N-  
 cycloalkyl-N-heterocyclylaminoalkyl, (the heterocyclyl  
 portions mentioned above being mono- or bicyclic aromatic),  
 carboxyl, alkyloxycarbonyl, -NRaRb or -CO-NRaRb for which Ra  
 and Rb are defined as above in the definition of R<sub>2</sub>, or  
 alternatively R°<sub>3</sub> represents -CR'b=CR'c-R'a for which R'a  
 represents phenyl, phenylalkyl, heterocyclyl or  
 heterocyclylalkyl in which the heterocyclyl portion is mono-  
 or bicyclic aromatic, phenoxyalkyl, phenylthioalkyl,  
 phenylsulfinylalkyl, phenylsulfonylalkyl, phenylaminoalkyl, N-

alkyl-N-phenylaminoalkyl, heterocyclyloxyalkyl,  
heterocyclylthioalkyl, heterocyclylsulfinylalkyl,  
heterocyclylsulfonylalkyl, heterocyclylaminoalkyl, N-alkyl-  
N-heterocyclylaminoalkyl, heterocyclylthio,  
heterocyclylsulfinyl, heterocyclylsulfonyl, (the heterocyclyl  
portions mentioned above being mono- or bicyclic aromatic),  
phenylthio, phenylsulfinyl, phenylsulfonyl, and for which R'<sup>b</sup>  
and R'<sup>c</sup> represent hydrogen, alkyl or cycloalkyl, or  
alternatively R'<sup>o</sup> represents a radical -C≡C-R<sub>d</sub> for which R<sub>d</sub> is  
alkyl, phenyl, phenylalkyl, phenoxyalkyl, phenylthioalkyl,  
N-alkyl-N-phenylaminoalkyl, mono- or bicyclic aromatic  
heterocyclyl, heterocyclylalkyl, heterocyclyloxyalkyl,  
heterocyclylthioalkyl, heterocyclylaminoalkyl,  
N-alkyl-N-heterocyclylaminoalkyl, (the heterocyclyl portions  
mentioned above being mono- or bicyclic aromatic), or  
alternatively R'<sup>o</sup> represents a -CF<sub>2</sub>-phenyl or mono- or bicyclic  
aromatic -CF<sub>2</sub>-heterocyclyl radical,

[017] Y represents a radical >CH-Re for which Re is  
hydrogen, fluoro, hydroxyl, alkyloxy, cycloalkyloxy, carboxyl,  
alkyloxycarbonyl, cycloalkyloxycarbonyl, -NR<sub>a</sub>R<sub>b</sub> or -CO-NR<sub>a</sub>R<sub>b</sub>  
for which R<sub>a</sub> and R<sub>b</sub> are defined as above for R<sub>2</sub> or one  
represents a hydrogen atom and the other represents an  
alkyloxycarbonyl, acyl, cycloalkylcarbonyl, benzoyl or  
heterocyclylcarbonyl radical in which the heterocyclyl portion

is mono- or bicyclic aromatic, or alternatively Y represents a difluoromethylene, carbonyl, hydroxyiminomethylene, alkyloxyiminomethylene or cycloalkyloxyiminomethylene radical or a 1,1-cycloalkylene radical containing 3 to 6 carbon atoms; and

[018] n is an integer from 0 to 4;

[019] it being understood that the phenyl, benzyl, benzoyl or heterocyclyl radicals or portions mentioned above may optionally be substituted on the ring with 1 to 4 substituents chosen from halogen, hydroxyl, alkyl, alkyloxy, alkyloxyalkyl, haloalkyl, trifluoromethyl, trifluoromethoxy, trifluoromethylthio, carboxyl, alkyloxycarbonyl, cyano, alkylamino, -NRaRb for which Ra and Rb are defined as above, phenyl, hydroxyalkyl, alkylthioalkyl, alkylsulfinylalkyl and alkylsulfonylalkyl,

[020] in their enantiomeric or diastereoisomeric forms or mixtures of these forms, and/or, where appropriate, in their syn or anti form or a mixture thereof, as well as the salts thereof, are powerful antibacterial agents.

[021] It is understood that the alkyl or acyl radicals and portions contain (except where especially mentioned) 1 to 10 carbon atoms in a straight or branched chain and that the cycloalkyl radicals contain 3 to 6 carbon atoms.

[022] It is also understood that the radicals which represent or bear a halogen atom represent a halogen chosen from fluorine, chlorine, bromine and iodine, wherein fluorine is an embodiment of particular interest.

[023] In the above general formula, when the radicals represent or bear a mono- or bicyclic aromatic heterocyclyl substituent, this substituent contains 5 to 10 chain members and may be chosen (in a nonlimiting manner) from thienyl, furyl, pyrrolyl, imidazolyl, thiazolyl, oxazolyl, thiadiazolyl, oxadiazolyl, tetrazolyl, pyridyl, pyridazinyl, pyrazinyl, pyrimidinyl, indolyl, benzothienyl, benzofuryl, indazolyl, benzothiazolyl, naphthyridinyl, quinolyl, isoquinolyl, cinnolyl, quinazolyl, quinoxalyl, benzoxazolyl and benzimidazolyl which may optionally be substituted with the substituents listed above.

[024] According to the invention, the products of general formula (I) may be obtained by coupling the chain  $R_3$  with the heterocyclylalkylpiperidine derivative of general formula:

[025]

[026] in which  $X_1$ ,  $X_2$ ,  $X_3$ ,  $X_4$ ,  $X_5$ ,  $R_1$ ,  $R_2$ ,  $Y$  and  $n$  are defined as above, and  $R_2$  is protected when it bears a carboxyl or amino radical, optionally followed by removal of the acid-protecting or amine-protecting radical, optional separation of the enantiomeric or diastereoisomeric forms and/or, where appropriate, of the syn or anti forms and optional conversion of the product obtained into a salt.

[027] The coupling of the chain  $R_3$  with the piperidine is advantageously carried out by the action of a derivative of general formula (IIa):

[029] in which  $R_3$  is defined as above and  $X$  represents a halogen atom, a methylsulfonyl radical, a trifluoromethylsulfonyl radical or a p-toluenesulfonyl radical, working in anhydrous medium, which is optionally inert (for example nitrogen or argon) in an organic solvent such as an amide (for example dimethylformamide), a ketone (for example acetone) or a nitrile (for example acetonitrile) in the presence of a base such as an organonitrogen base (for example triethylamine) or a mineral base (alkaline carbonate, for example potassium carbonate) at a temperature of between 20°C and the reflux temperature of the solvent. It is understood that the nitrogen atom of the piperidine in the derivative of general formula (II) is optionally protected

according to the usual methods which do not affect the rest of the molecule or the reaction; for example, the protection is carried out by a protecting radical chosen from t-butoxycarbonyl and benzyloxycarbonyl.

[030] In one embodiment of the invention, a derivative of general formula (IIa) for which X is a bromine or iodine atom is reacted.

[031] When  $R_3$  is a phenyl radical, it is also possible to act on the iodo or bromo derivative  $R_3-X$  in the presence of a palladium catalyst according to the method described in *J. Org. Chem.*, 6066 (1997) or *Tet. Lett.*, 6359 (1997). The palladium catalyst may be chosen from tris(dibenzylideneacetone)dipalladium, and palladium diacetate with a ligand such as 2,2'-bis(diphenylphosphino)-1,1'-binaphthyl or 2-(di-t-butylphosphino)biphenyl, for example, a base such as sodium tert-butoxide or cesium carbonate in a solvent such as tetrahydrofuran, tetraglyme or toluene, optionally in the presence of a crown ether such as 18-C-6 (1,4,7,10,13,16-hexaoxacyclooctadecane). The reaction is carried out at a temperature of between 20°C and 110°C.

[032] When  $R_3$  represents a radical  $-alk-R^{\circ}_3$  for which alk is an alkyl radical and  $R^{\circ}_3$  represents  $-C\equiv C-R_d$  in which  $R_d$  is phenyl, phenylalkyl, heterocyclyl or mono- or bicyclic aromatic heterocyclylalkyl, optionally one may couple an

alkynyl halide:  $\text{HC}\equiv\text{C-alk-X}$  for which alk is defined as above and X is a halogen atom, and then may substitute the chain with a phenyl, phenylalkyl, heterocyclyl or heterocyclylalkyl radical.

[033] In this alternative, the addition of the alkynyl chain is carried out using an alkynyl halide  $\text{HC}\equiv\text{C-alk-X}$  for which X is optionally a bromine atom, under the conditions listed above for the coupling of the chain  $\text{R}_3$ , in the presence or absence of an alkali metal iodide such as, for example, potassium iodide or sodium iodide.

[034] The substitution with a phenyl or heterocyclyl radical is carried out by the action of a halide derived from the cyclic radical to be substituted, in the presence of triethylamine, in anhydrous medium in a solvent such as an amide (for example dimethylformamide) or a nitrile (for example acetonitrile) and in the presence of a palladium salt such as, for example, tetrakis(triphenylphosphine)palladium and cuprous iodide, at a temperature of between  $20^\circ\text{C}$  and the reflux temperature of the solvent.

[035] The substitution with a phenylalkyl or heterocyclylalkyl radical is carried out by the action of the corresponding halide, in basic medium, for example in the presence of potassium hydride or sodium hydride or n-butyllithium, in a solvent such as an ether (tetrahydrofuran)

or an amide (dimethylformamide) at a temperature of between -60°C and the boiling point of the reaction medium.

[036] It is understood that, if the alkyl radicals represented by  $R_3$  bear carboxyl or amino substituents, these substituents are protected beforehand then freed after the reaction. The process is performed according to the usual methods which do not affect the rest of the molecule, in particular according to the methods described by T.W. Greene and P.G.M. Wuts, *Protective Groups in Organic Synthesis* (2<sup>nd</sup> edition), A. Wiley - Interscience Publication (1991), or by McOmie, *Protective Groups in Organic Chemistry*, Plenum Press (1973).

[037] The protected carboxyl radical borne by  $R_2$  may be chosen from readily hydrolyzable esters. Examples are the methyl, benzyl, and tert-butyl esters, or the phenyl propyl or allyl esters. The protection of the carboxyl radical is optionally carried out at the same time as the reaction.

[038] Where appropriate, the amino radical is protected using the usual protecting radicals mentioned in the above references.

[039] These protecting radicals are installed and removed according to the usual methods, mentioned above for  $R_3$ .

[040] When  $R_3$  represents a radical-alk- $R_3^\bullet$  for which alk is an alkyl radical and  $R_3^\bullet$  represents a phenoxy, phenylthio, phenylamino, heterocyclyloxy, heterocyclylthio or heterocyclylamino radical in which the heterocyclyl portion is aromatic, optionally the chain may be constructed step by step, by first condensing a chain HO-alk-X, for which X is a halogen atom (optionally iodine), under the conditions described above for the reaction of the product of general formula (IIa), and then by converting the hydroxyalkyl chain into a haloalkyl, methanesulfonylalkyl or p-toluenesulfonylalkyl chain, and finally by reacting, in basic medium, an aromatic derivative of structure Ar-ZH for which AR is an aromatic phenyl or heterocyclyl radical and Z is a sulfur, oxygen or nitrogen atom.

[041] The conversion of the hydroxylated chain into a haloalkyl or p-toluenesulfonyl chain is carried out according to the usual methods of halogenation or sulfonylation, especially by reacting a halogenating agent, for instance, thionyl chloride, halophosphorus derivatives: for example phosphorus trichloride or tribromide or a sulfonylating agent such as, for example, methanesulfonyl chloride, p-toluenesulfonyl chloride or trifluoromethanesulfonic anhydride. The reaction is carried out in an organic solvent, for instance a chlorinated solvent (for example

dichloromethane or chloroform), at a temperature of between 0°C and 60°C. In certain cases, it may be advantageous to work in the presence of a base, for instance pyridine or triethylamine.

[042] The reaction of the aromatic derivative Ar-ZH is advantageously carried out as described above for the action of the derivative of general formula (IIa), in the presence of a base, for example such as a nitrogenous base, in an organic solvent such as an amide (for example dimethylformamide), a ketone (for example acetone) or a nitrile (for example acetonitrile), in the presence of a base such as a nitrogenous organic base (for example triethylamine) or a mineral base (alkali metal carbonate: for example potassium carbonate) at a temperature of between 20°C and the reflux temperature of the reaction mixture. It may be advantageous to work in the presence of potassium iodide.

[043] According to the invention, the heterocyclyl-alkylpiperidine derivatives of general formula (II) may be prepared according to the coupling method described below, and then where appropriate converted according to one of the methods ① to ⑨ below, via a subsequent operation starting with one of the derivatives of general formula (II) already obtained, to prepare the derivatives corresponding to the

various alternatives of Y and/or of R<sub>1</sub>, R'<sub>1</sub>, R'<sub>2</sub>, R'<sub>3</sub>, R'<sub>4</sub> or R'<sub>5</sub>.

[044] It is understood that when carboxylic acid radicals are present on the molecule, these radicals are protected beforehand and then freed after the reaction according to the usual methods which do not affect the rest of the molecule, especially according to the methods mentioned in the references cited above. It is also understood that, prior to the reactions which may interfere with the amine of the piperidine in the derivative of general formula (II), this amine is protected, and then freed after the reaction. The protection is carried out according to the usual methods, as specified above, especially via a t-butoxycarbonyl or benzyloxycarbonyl radical.

[045] According to the invention, the preparation of the products of general formula (II) for which Re in Y is a hydrogen atom is carried out by coupling a heterocyclic derivative of general formula:

[046]

[047] in which  $R_1$ ,  $X_1$ ,  $X_2$ ,  $X_3$ ,  $X_4$  and  $X_5$  are defined as above and Hal represents a halogen atom, with a piperidine derivative of general formula:

[048]

[049] in which  $\text{R}_z$  is a protecting radical and  $\text{R}''_2$  is defined as above or represents a protected radical if  $\text{R}_2$  represents or bears a carboxylic acid function, followed by removal of the protecting radicals and/or followed by conversion, via a subsequent operation, of the substituents of the bicycle of the heterocyclalkylpiperidine derivative of general formula (II) thus obtained, to give the expected derivative bearing the radical  $\text{R}_1$ ,  $\text{R}'_1$ ,  $\text{R}'_2$ ,  $\text{R}'_3$ ,  $\text{R}'_4$ , or  $\text{R}'_5$ , and, where appropriate, removal of the protecting radical(s) still present on the molecule.

[050] The radical  $\text{R}_z$  may be any protecting group for the nitrogen atom which is compatible with the reaction (for example t-butyloxycarbonyl or benzyloxycarbonyl). The protecting groups for the acid functions are chosen from the usual groups whose installation and removal do not affect the rest of the molecule, especially those mentioned in the references cited above.

[051] The reaction is carried out by the successive action of an organoborane (for example 9-borabicyclo-[3.3.1]nonane) in a solvent such as an ether (for example

tetrahydrofuran or dioxane) at a temperature of between  $-20^{\circ}\text{C}$  and  $20^{\circ}\text{C}$ , and then of the bicyclic derivative of general formula (III) wherein Hal optionally represents a bromine or iodine atom or a chlorine atom, by analogy with the methods described by Suzuki et al., *Pure and Appl. Chem.*, **57**, 1749 (1985). The reaction is generally carried out in the presence of a palladium salt (for example diphenylphosphinoferrocenepalladium chloride) and of a base such as potassium phosphate, at a temperature of between  $20^{\circ}\text{C}$  and the reflux temperature of the solvent.

[052]      ① The heterocyclalalkylpiperidines of general formula (II) for which Re in Y represents a hydroxyl radical may be prepared by oxidation in basic medium of the corresponding heterocyclalalkylpiperidine derivative of general formula (II) for which Re in Y is a hydrogen atom. The oxidation is carried out by the action of oxygen, optionally in an inert solvent such as dimethyl sulfoxide in the presence of tert-butanol and of a base such as potassium tert-butoxide or sodium tert-butoxide at a temperature of between  $0^{\circ}\text{C}$  and  $100^{\circ}\text{C}$ .

[053]      The heterocyclalalkylpiperidine derivative for which Re in Y is a fluorine atom is prepared by fluorination starting with a derivative for which Re is hydroxyl. The reaction is carried out in the presence of a sulfur fluoride

[for example in the presence of an aminosulfur trifluoride (diethylaminosulfur trifluoride (*Tetrahedron*, **44**, 2875 (1988), bis(2-methoxyethyl)aminosulfur trifluoride (Deoxofluor®), or morpholinosulfur trifluoride, for example) or alternatively in the presence of sulfur tetrafluoride (*J. Org. Chem.*, **40**, 3808 (1975); alternatively, the fluorination reaction can also be carried out using a fluorinating agent such as hexafluoropropyldiethylamine (JP 2 039 546) or N-(2-chloro-1,1,2-trifluoroethyl)diethylamine.

[054] The process is performed in an organic solvent such as a chlorinated solvent (for example dichloromethane, dichloroethane or chloroform), or in an ether (for example tetrahydrofuran or dioxane), at a temperature of between -78°C and 40°C, or optionally between 0°C and 30°C. It is advantageous to work in inert medium (especially argon or nitrogen).

[055] The heterocyclalkylpiperidine derivative of general formula (II) for which Re in Y is an alkyloxy or cycloalkyloxy radical is prepared by the action of an alkyl or cycloalkyl halide on the corresponding derivative of general formula (II) for which Re is hydroxyl. The reaction is generally carried out using the bromide or chloride, in an inert solvent such as N,N-dimethylformamide or dimethyl sulfoxide, in the presence of an acid acceptor such as a

trialkylamine (for example triethylamine) or an alkali metal hydride (for example sodium hydride), at a temperature of between 20°C and 100°C.

[056] The heterocyclalalkylpiperidine derivative of general formula (II) for which Y is a carbonyl radical may be prepared by oxidation of the corresponding derivative of general formula (II) for which Re in Y is a hydroxyl radical.

This oxidation is carried out, for example, using potassium permanganate optionally in a solution of sodium hydroxide (for example 3N sodium hydroxide), at a temperature of between -20°C and 20°C, or alternatively by the action of oxalyl chloride in the presence of dimethyl sulfoxide, followed by the addition of an amine such as triethylamine, in an inert solvent such as dichloromethane or dimethyl sulfoxide, at a temperature of between -60°C and 20°C, by analogy with the method described by D. Swern et al., *J. Org. Chem.*, **44**, 4148 (1979).

[057] The heterocyclalalkylpiperidine derivative of general formula (II) for which Y is a difluoromethylene radical may be prepared by dihalogenation of the product of general formula (II) for which Y is carbonyl, under conditions analogous to those of the fluorination described above.

[058] The heterocyclalalkylpiperidine derivative of general formula (II) for which Y is a hydroxyiminomethylene

radical may be prepared by the action of hydroxylamine on a derivative of general formula (II) for which Y is a carbonyl radical. The reaction is generally carried out in an inert solvent such as an alcohol (methanol or ethanol) and optionally in the presence of sodium hydroxide (for example 1N sodium hydroxide), at a temperature of between 0°C and the boiling point of the reaction mixture.

[059] The heterocyclalkylpiperidine derivative of general formula (II) for which Y is an alkyloxyiminomethylene or cycloalkyloxyiminomethylene radical may be prepared by the action of an alkyl or cycloalkyl halide on the corresponding derivative of general formula (II) for which Y is hydroxyiminomethylene. The reaction is generally carried out in an inert solvent such as N,N-dimethylformamide or dimethyl sulfoxide, in the presence of an acid acceptor such as a trialkylamine (for example triethylamine) or an alkali metal hydride (for example sodium hydride), at a temperature of between 20°C and 100°C. A bromide is one example of interest in the present invention.

[060] The heterocyclalkylpiperidine derivative of general formula (II) for which Re in Y is a radical -NRaRb may be prepared from the corresponding tosyloxy derivative by the action of an amine HNRaRb (or, where appropriate, of ammonia when Re is -NH<sub>2</sub>) in an inert solvent such as N,N-

dimethylformamide or dimethyl sulfoxide, at a temperature of between 20°C and the boiling point of the reaction mixture. When ammonia is reacted, the process is optionally performed under pressure (2 to 20 atmospheres) at a temperature of between 20°C and 100°C. When the process is performed using an amine  $\text{HNRaRb}$ , the reaction is optionally carried out in the presence of a base such as a trialkylamine (for example triethylamine), pyridine or an alkali metal hydride (for example sodium hydride).

[061] The derivative for which Re in Y is tosyloxy is obtained from the product of general formula (II) for which Re in Y is hydroxyl, by the action of tosyl chloride in pyridine, at a temperature of between -10°C and 20°C.

[062] The heterocyclalalkylpiperidine derivative of general formula (II) for which Re in Y is a carboxyl radical may be prepared by the action of an alkaline cyanide on the corresponding tosyloxy derivative, in an organic solvent such as dimethylformamide or dimethyl sulfoxide or in aqueous-organic medium, for example a water-alcohol mixture, at a temperature of between 0°C and the boiling point of the reaction mixture, followed by hydrolysis of the nitrile obtained by the action of a strong acid such as hydrochloric acid, and optionally of a lower aliphatic alcohol, at a temperature of between 0°C and the boiling point of the

reaction mixture. Sodium cyanide or potassium cyanide are both options according to the present invention.

[063] The heterocyclalkylpiperidine derivative of general formula (II) for which Re in Y is an alkyloxycarbonyl or cycloalkyloxycarbonyl or -CO-NRaRb radical may be prepared by the action, respectively, of the alcohol or of the corresponding amine on the derivative of general formula (II) for which Re in Y is a carboxyl radical. The reaction is carried out in the presence of a coupling agent such as a carbodiimide (for example N,N'-dicyclohexylcarbodiimide) or N,N'-carbonyldiimidazole, in an inert solvent such as an ether (for example tetrahydrofuran or dioxane), an amide (N,N-dimethylformamide), a chlorinated solvent (for example methylene chloride, 1,2-dichloroethane or chloroform) or dimethyl sulfoxide, at a temperature of between 0°C and the reflux temperature of the reaction mixture.

[064] ② The heterocyclalkylpiperidine derivative of general formula (II) for which Y is a 1,1-cycloalkylene radical may be prepared by the action, in basic medium, of a product of structure Hal-Alk-Hal for which Alk is an alkylene radical corresponding to the expected cycloalkylene, on a heterocyclalkylpiperidine derivative for which Re in Y is a hydrogen atom. The reaction is generally carried out in an inert solvent such as N,N-dimethylformamide or dimethyl

sulfoxide, in the presence of an acid acceptor such as an alkali metal hydride (for example sodium hydride), at a temperature of between 20°C and 100°C.

[065]      ③ The heterocyclylalkylpiperidine derivatives of general formula (II) for which one from among  $R_1$ ,  $R'_1$ ,  $R'_2$ ,  $R'_3$ ,  $R'_4$  and  $R'_5$  represents an alkyl, cycloalkyl, phenyl, heterocyclyl, benzyl or heterocyclylmethyl radical may be prepared by the action of a boron derivative of structure  $R'_iB(OH)_2$  ( $R'_i$  meaning one of the substituents  $R_1$ ,  $R'_1$ ,  $R'_2$ ,  $R'_3$ ,  $R'_4$  or  $R'_5$ ) or of 9-alkyl- (or 9-cycloalkyl)-9-borabicyclo[3.3.1]nonane structure on a derivative of general formula (II) for which the substituent  $R'_i$  is a bromine, iodine or chlorine atom, by analogy with the methods described by F. Diederich and P. J. Stang, *Metal Catalysed Cross-coupling Reactions*, Wiley-VCH, (1997) in the presence of a palladium salt (for example tetrakis(triphenylphosphine) or diphenylphosphinoferrocenepalladium chloride) and of a base such as potassium phosphate, in an inert solvent such as an amide (for example N,N-dimethylformamide), an ether (for example tetrahydrofuran) or a nitrile (for example acetonitrile), at a temperature of between 20°C and the reflux temperature of the reaction mixture.

[066]      ④ The heterocyclylalkylpiperidine derivatives of general formula (II) for which one from among  $R_1$ ,  $R'_1$ ,  $R'_2$ ,

$R'_3$ ,  $R'_4$  and  $R'_5$  represents a radical -NRaRb may be prepared by the action of an amine HNRaRb on a derivative of general formula (II) for which the substituent  $R'_i$  ( $R'_i$  meaning one of the substituents  $R_1$ ,  $R'_1$ ,  $R'_2$ ,  $R'_3$ ,  $R'_4$  or  $R'_5$ ) is a bromine, iodine or chlorine atom, by analogy with the methods described in *J. Org. Chem.*, 6066 (1997) and *Tetrahedron Lett.*, 6359 (1997) in the presence of a palladium catalyst; under conditions similar to those described for the reaction of the halo derivative of formula (III) with the derivative of general formula (II).

[067] When Ra and Rb represent hydrogen atoms, the amino derivative obtained may be converted into a fluoro derivative by the action of an alkaline nitrite (for example sodium nitrite) in acidic medium (tetrafluoroboric acid or hexafluorophosphoric acid) in water at a temperature of between  $-10^{\circ}\text{C}$  and  $20^{\circ}\text{C}$ , to prepare a diazonium tetrafluoroborate or hexafluorophosphate, followed by pyrolysis of the product obtained according to the Baz-Schieman reaction, *Org. Synth.*, Coll 5, 133 (1973).

[068] ⑤ The heterocyclalkylpiperidine derivatives of general formula (II) for which  $R_1$ ,  $R'_1$ ,  $R'_2$ ,  $R'_3$ ,  $R'_4$  or  $R'_5$  represents an alkyloxy, alkylthio, cycloalkyloxy, cycloalkylthio, benzyloxy or heterocyclmethylmethoxy radical, may be prepared by the action of the alcohol or of the

corresponding thiol on the heterocyclalkylpiperidine derivative for which one of the radicals  $R'_i$  is a bromine, iodine or chlorine atom. The reaction is generally carried out in an inert solvent such as an ether (for example tetrahydrofuran or dioxane), an amide (for example N,N-dimethylformamide) or dimethyl sulfoxide, in the presence of an acid acceptor such as a trialkylamine (for example triethylamine), an alkali metal hydride (for example sodium hydride), methyllithium or n-butyllithium, at a temperature of between 0°C and the reflux temperature of the reaction mixture.

[069] The heterocyclalkylpiperidine derivatives of general formula (II) for which  $R_1$ ,  $R'_1$ ,  $R'_2$ ,  $R'_3$ ,  $R'_4$  or  $R'_5$  represents a hydroxyl radical may be prepared from the corresponding derivative for which one of the radicals  $R'_i$  is methoxy by the action of a strong acid such as hydrobromic acid, at a temperature of between 20°C and the reflux temperature of the reaction mixture.

[070] The heterocyclalkylpiperidine derivatives of general formula (II) for which  $R_1$ ,  $R'_1$ ,  $R'_2$ ,  $R'_3$ ,  $R'_4$  or  $R'_5$  represents a trifluoromethoxy radical may be obtained by analogy with the method described by Sun W.Y. Synlett., **11**, 1279 (1997) to prepare a derivative for which  $R'_i$  is an -O-CS-SCH<sub>3</sub> radical, starting with the corresponding hydroxyl

derivative; this radical is converted into a trifluoromethyl radical by applying the methods described by Kuroboshi M. et al., *Tetrahedron Lett.*, **33**(29), 4173 (1992) in the presence of 1,3-dibromo-5,5-dimethylhydantoin in an HF-pyridine complex at a temperature of between 0°C and 20°C.

[071] The heterocyclalkylpiperidine derivatives of general formula (II) for which  $R_1$ ,  $R'_1$ ,  $R'_2$ ,  $R'_3$ ,  $R'_4$  or  $R'_5$  represents an alkyloxy, cycloalkyloxy, phenoxy, benzyloxy, heterocyclxyloxy or heterocyclmethylxyloxy radical may be obtained by the action of the corresponding halo derivative on the derivative of general formula (II) for which the  $R'_i$  to be modified is hydroxyl. The process is optionally performed using the bromo derivative, in an inert solvent such as an ether (for example tetrahydrofuran or dioxane), an amide (for example N,N-dimethylformamide) or dimethyl sulfoxide, in the presence of an acid acceptor such as a trialkylamine (for example triethylamine), an alkali metal hydride (for example sodium hydride), methyllithium or N-butyllithium, optionally in the presence of a palladium salt (by analogy with the methods described in *J. Am. Chem. Soc.*, 4369 (1999); *Tetrahedron Lett.*, 8005 (1997); *Angew. Chem. Int. Ed. Engl.*, 2047 (1998)), at a temperature of between 0°C and the reflux temperature of the reaction mixture.

[072]        ⑥ The heterocyclalkylpiperidine derivatives of general formula (II) for which  $R_1$  represents a trifluoromethyl radical may be prepared by the action of a trifluoromethylating agent (especially a bromo derivative  $Br-CF_3$  or an iodo derivative  $I-CF_3$ ) on the heterocyclalkylpiperidine derivative for which one of the radicals  $R_1$  is a bromine, iodine or chlorine atom, in the presence of copper or a copper(I) salt such as  $CuI$ , in a solvent such as dimethylformamide, between 20°C and 150°C, by analogy with *J.C.S. Chem. Commun.*, **1**, 53 (1992) or *Chem. Commun.*, **18**, 1389 (1993).

[073]        ⑦ The heterocyclalkylpiperidine derivatives of general formula (II) for which  $R_1$ ,  $R'_1$ ,  $R'_2$ ,  $R'_3$ ,  $R'_4$  or  $R'_5$  represents an alkylthio, cycloalkylthio, trifluoromethylthio, phenylthio or heterocyclalkylthio radical may be obtained by the action of the corresponding halo derivative on the heterocyclalkylpiperidine derivative bearing a mercapto substituent. In one embodiment of the present invention, the process is performed using the bromo derivative, under the conditions described above for the action of a halo derivative on an alcohol, at a temperature of between 20°C and the reflux temperature of the reaction mixture. In the case of the trifluoromethylthio radical, the process is performed by

analogy with the method described in *Tet. Lett.*, **33**(44), 6677 (1992).

[074] The mercapto derivative of the heterocyclylalkylpiperidine of general formula (II) may be obtained from the heterocyclylalkylpiperidine derivative for which one of the radicals  $R'_i$  is a bromine, iodine or chlorine atom (in one embodiment of interest, a bromine atom) by analogy with the methods described by Q.L. Zhou et al., *Tetrahedron*, **15**, 4467 (1994); C. Bieniauz et al., *Tetrahedron Letters*, **34**, 6, 939 (1993) and E.D. Amstutz, *J. Am. Chem. Soc.*, **68**, 498 (1946). The reaction is carried out, for example, in the presence of  $\text{Na}_3\text{PO}_3\text{S}$  or  $\text{Na}_2\text{S}$  in an inert solvent such as an alcohol (for example methanol or ethanol), optionally in the presence of water, at a temperature of between 20°C and the reflux temperature of the reaction mixture.

[075] ⑧ The heterocyclylalkylpiperidine derivatives of general formula (II) for which  $R_1$ ,  $R'_1$ ,  $R'_2$ ,  $R'_3$ ,  $R'_4$  or  $R'_5$  represents a cyano radical may be obtained from the corresponding derivative for which one of the radicals  $R'_i$  is a halogen atom, optionally a bromine or iodine atom, by applying the methods described by Halley F. et al., *Synth. Comm.*, **27**(7), 1199 (1997) and Tschaen D. M. et al., *J. Org. Chem.*, **60**(14), 4324 (1995), in the presence of  $\text{CuCN}$ , or  $\text{KCN}$  and optionally in the presence of a catalyst.

[076]        The heterocyclalalkylpiperidine derivatives of general formula (II) for which  $R_1$ ,  $R'_1$ ,  $R'_2$ ,  $R'_3$ ,  $R'_4$  or  $R'_5$  represents a carboxyl, alkyloxy carbonyl, cycloalkyloxy carbonyl or  $-CO-NR_aR_b$  radical may be prepared from the cyano derivative, according to the usual methods for conversion into an acid, an ester and an amide, which do not affect the rest of the molecule, and some of the implementation conditions of which have been recalled above. In particular, in the presence of a carbodiimide (N,N'-dicyclohexylcarbodiimide) or N,N'-carbonyldiimidazole, in an ether (tetrahydrofuran or dioxane), an amide (N,N-dimethylformamide) or a chlorinated solvent (methylene chloride, 1,2-dichloroethane or chloroform), at a temperature of between 0°C and the reflux temperature of the reaction mixture.

[077]        ⑨ The heterocyclalalkylpiperidine derivatives of general formula (II) for which  $R_1$ ,  $R'_1$ ,  $R'_2$ ,  $R'_3$ ,  $R'_4$  or  $R'_5$  represents a hydroxymethyl radical may be obtained by reducing a heterocyclalalkylpiperidine derivative of general formula (II) for which one of the radicals  $R'_1$  represents a carboxyl radical, using a reducing agent such as, for example, lithium aluminum hydride or a borohydride, in an inert solvent such as an ether (for example tetrahydrofuran or dioxane) or a chlorinated solvent (for example methylene chloride, 1,2-

dichloroethane or chloroform), at a temperature of between 0°C and the reflux temperature of the reaction mixture.

[078] The heterocyclylalkylpiperidine derivatives of general formula (II) for which  $R_1$ ,  $R'_1$ ,  $R'_2$ ,  $R'_3$ ,  $R'_4$  or  $R'_5$  represents an alkyloxymethyl or cycloalkyloxymethyl radical may be obtained by the action of the corresponding halo derivative (optionally the bromo derivative) on the corresponding heterocyclyl-alkylpiperidine derivative for which the radical  $R'_i$  represents a hydroxymethyl radical. The reaction is generally carried out in an inert solvent such as an ether (for example tetrahydrofuran or dioxane), an amide (for example N,N-dimethylformamide) or dimethyl sulfoxide, in the presence of an acid acceptor such as a trialkylamine (for example triethylamine) or an alkali metal hydride (for example sodium hydride), at a temperature of between 20°C and 100°C.

[079] The heterocyclylalkylpiperidine derivatives of general formula (II) for which  $R_1$ ,  $R'_1$ ,  $R'_2$ ,  $R'_3$ ,  $R'_4$  or  $R'_5$  represents a fluoromethyl radical may be obtained by the action of a fluorinating agent on the heterocyclylalkylpiperidine derivative for which the corresponding radical  $R'_i$  represents a hydroxymethyl radical.

The reaction may be carried out under the fluorinating conditions described above for the installation of a radical Re meaning fluorine.

[080] The heterocyclalalkylpiperidine derivatives of general formula (II) for which  $R_1$ ,  $R'_1$ ,  $R'_2$ ,  $R'_3$ ,  $R'_4$  or  $R'_5$  represents an alkylthiomethyl or cycloalkylthiomethyl radical may be obtained by the action of the corresponding thiol on a heterocyclalalkylpiperidine derivative for which the radical  $R'_i$  to be modified is halomethyl (wherein halogens according to one aspect of the invention are a bromine or a chlorine atom). The reaction is generally carried out in an inert solvent such as an ether (for example tetrahydrofuran or dioxane), an amide (for example N,N-dimethylformamide) or dimethyl sulfoxide, in the presence of an acid acceptor such as a trialkylamine (for example triethylamine) or an alkali metal hydride (for example sodium hydride), at a temperature of between 20°C and the reflux temperature of the reaction mixture.

[081] The heterocyclalalkylpiperidine derivatives bearing a halomethyl radical  $R'_i$  are prepared from the corresponding derivative for which  $R'_i$  is a hydroxymethyl radical by the action of a halogenating agent (halophosphorus derivative or thionyl chloride). The reaction is optionally carried out in an inert solvent such as dichloromethane, at a temperature of between 0°C and 60°C, optionally in the presence of a base such as pyridine.

[082] The heterocyclalkylpiperidine derivatives of general formula (II) for which  $R_1$ ,  $R'_1$ ,  $R'_2$ ,  $R'_3$ ,  $R'_4$ , or  $R'_5$  represents a radical  $-CH_2-NR_aR_b$  may be obtained by the action of an amine  $HNR_aR_b$  on a heterocyclalkylpiperidine derivative for which the radical  $R'_1$  to be modified is halomethyl (the halogen optionally being a bromine or chlorine atom). The reaction is carried out in an inert solvent such as an ether (for example tetrahydrofuran or dioxane), an amide (for example N,N-dimethylformamide) or dimethyl sulfoxide, in the presence of an acid acceptor such as a trialkylamine (for example triethylamine) or an alkali metal hydride (for example sodium hydride), at a temperature of between 20°C and the reflux temperature of the reaction mixture. The halomethyl derivative is prepared as described above.

[083] The heterocyclalkylpiperidine derivatives of general formula (II) for which  $R_1$ ,  $R'_1$ ,  $R'_2$ ,  $R'_3$ ,  $R'_4$ , or  $R'_5$  represents a carboxymethyl radical may be obtained by the action of an alkaline cyanide on a heterocyclalkylpiperidine derivative for which the radical  $R'_1$  to be modified is halomethyl (the halogen optionally being a bromine or chlorine atom), followed by hydrolysis of the nitrile. The reaction is carried out using sodium cyanide or potassium cyanide in an organic solvent such as dimethyl sulfoxide or dimethylformamide, or in a water-alcohol mixture, at a

temperature of between 0°C and the boiling point of the reaction mixture, followed by the action of a strong acid such as hydrochloric acid, optionally in the presence of a lower aliphatic alcohol, at a temperature of between 0°C and the boiling point of the reaction mixture.

[084] The heterocyclalalkylpiperidine derivatives of general formula (II) for which  $R_1$ ,  $R'_1$ ,  $R'_2$ ,  $R'_3$ ,  $R'_4$ , or  $R'_5$  represents an alkyloxycarbonylmethyl, cycloalkyloxy-carbonylmethyl or  $-\text{CH}_2-\text{CO}-\text{NRaRb}$  radical may be obtained from the corresponding acid according to the usual methods for converting an acid to an ester or amide which do not affect the rest of the molecule, especially in the presence of a coupling agent such as a carbodiimide as described above.

[085] The heterocyclic derivatives of general formula (III) for which Hal is a bromine atom,  $R_1$  is defined as above,  $X_1$  to  $X_4$  represent, respectively,  $>\text{C}-\text{R}'_1$  to  $>\text{C}-\text{R}'_4$  and  $X_5$  represents  $>\text{CH}$ , may be prepared by brominating the corresponding 4-hydroxyquinolines using a brominating agent such as phosphorus oxitribromide or thionyl bromide without a solvent, at a temperature of between 20°C and 115°C.

[086] The 4-hydroxyquinolines may be prepared by decarboxylating the corresponding 3-carboxy-4-hydroxy-quinolines, working in a solvent such as diphenyl ether at a temperature of between 100°C and 260°C.

[087] The 3-carboxy-4-hydroxyquinolines may be prepared by analogy with the method described in European patent application EP-A-0 379 412, starting with the desired aniline derivative.

[088] The heterocyclic derivatives of general formula (III) for which Hal is a bromine atom,  $R_1$  is defined as above,  $X_1$  to  $X_4$  represent, respectively,  $>C-R'_1$  to  $>C-R'_4$  and  $X_5$  represents  $>C-Cl$ , may be prepared by brominating the corresponding 3-chloro-4-hydroxyquinoline. The bromination is generally carried out with triphenylphosphine dibromide in acetonitrile at a temperature of between 20°C and 85°C.

[089] The 3-chloro-4-hydroxyquinolines may be prepared by chlorinating a 4-hydroxyquinoline. The chlorination is carried out, for example, using N-chlorosuccinimide in a solvent such as acetic acid, at a temperature of between 20°C and 100°C.

[090] The heterocyclic derivatives of general formula (III) for which Hal is a bromine atom,  $R_1$  is defined as above,  $X_1$  to  $X_4$  represent, respectively,  $>C-R'_1$  to  $>C-R'_4$  and  $X_5$  represents  $>C-COCF_3$  may be prepared by analogy with the preparation of the derivatives for which  $X_5$  represents  $>CH$ , by brominating the corresponding 4-hydroxy-3-fluoroacetylquinoline derivative. The reaction is carried out without a solvent, using a brominating agent such as

phosphorus oxytribromide, at a temperature of between 20°C and 115°C. The 4-hydroxy-3-trifluoroacetylquinoline may be prepared by analogy with the method described for the preparation of 3-carboxy-4-hydroxyquinoline.

[091] The heterocyclic derivatives of general formula (III) for which Hal is an iodine atom, R<sub>1</sub> is a methoxy radical, X<sub>1</sub> to X<sub>4</sub> represent, respectively, >C-R'<sub>1</sub> to >C-R'<sub>4</sub> and X<sub>5</sub> represents >C-F, may be prepared by analogy with the studies of E. Arzel *et al.*, *Tetrahedron*, **55**, 12149-12156 (1999) starting with 3-fluoro-6-methoxyquinoline, by the successive action of a base and then iodine. For example, lithium diisopropylamide in a solvent such as an ether (tetrahydrofuran) at a temperature of between -80°C and 20°C is used.

[092] The 3-fluoro-6-methoxyquinoline may be obtained by pyrolysis of 6-methoxyquinoline diazonium 3-tetrafluoroborate or 3-hexafluorophosphate according to the Balz-Schieman reaction, *Org. Synth.*, Coll 5, 133 (1973), at a temperature of between 100°C and 240°C. 6-Methoxyquinoline diazonium 3-tetrafluoroborate or 6-methoxyquinoline diazonium 3-hexafluorophosphate may be obtained from 3-amino-6-methoxyquinoline by the action of an alkaline nitrite (for example sodium nitrite) in acidic medium (tetrafluoroboric acid or hexafluorophosphoric acid) in a solvent such as water

at a temperature of between  $-10^{\circ}\text{C}$  and  $+20^{\circ}\text{C}$ , by analogy with the studies of A. Roe et al., *J. Am. Chem. Soc.*, **71**, 1785-86 (1949) or by the action of an alkyl nitrite (such as, for example, isoamyl nitrite) and of the trifluoroborate/diethyl ether complex in a solvent such as an ether (for example tetrahydrofuran) at a temperature of between  $-10^{\circ}\text{C}$  and  $+10^{\circ}\text{C}$ .

[093] 3-Amino-6-methoxyquinoline is prepared as described by N. Heindel, *J. Med. Chem.* **13**, 760 (1970).

[094] The heterocyclic derivatives of general formula (III) for which Hal is a bromine atom,  $R_1$  is defined as above,  $X_2$  to  $X_4$  represent, respectively,  $>\text{C}-R'_2$  to  $>\text{C}-R'_4$  and  $X_1$  represents a nitrogen atom or alternatively  $X_1$ ,  $X_3$ , and  $X_4$  represent, respectively,  $>\text{C}-R'_1$ ,  $>\text{C}-R'_3$ , and  $>\text{C}-R'_4$  and  $X_2$  represents a nitrogen atom, and  $X_5$  represents  $>\text{CH}$  or  $>\text{C}-\text{Cl}$ , may be prepared by analogy with the methods described above when  $X_1$  to  $X_4$  represent, respectively,  $>\text{C}-R'_1$  to  $>\text{C}-R'_4$  or according to the syntheses described by Adams J.T. et al., *J. Am. Chem. Soc.*, **68**, 1317 (1946) for the 1,5-naphthyridines and S. Radl et al., *Collect. Czech. Chem. Commun.*, **56**, 2420 (1991) for the 1,7-naphthyridines, starting with 3-aminopyridines.

[095] The hydroxynaphthyridine required to carry out the reaction is also prepared by analogy with the methods described above for the hydroxyquinolines, but starting with 3-aminopyridine or its substituted derivatives. The 3-

aminopyridine derivatives may be obtained by adaptation of the methods described in "The Chemistry of Heterocyclic Compounds", Vol. 14, *Pyridine and its Derivatives, Supplement Part III*, page 41. Ed. R.A. Abramovitch, InterScience Publication.

[096] The heterocyclic derivatives of general formula (III) for which Hal is a bromine atom,  $R_1$  is defined as above,  $X_1$ ,  $X_2$ , and  $X_4$  represent, respectively,  $>C-R'_1$ ,  $>C-R'_2$ , and  $>C-R'_4$ ,  $X_3$  represents a nitrogen atom and  $X_5$  represents  $>CH$  or  $>C-Cl$ , may be prepared by analogy with the methods described above when  $X_1$  to  $X_4$  represent respectively,  $>C-R'_1$  to  $>C-R'_4$  or according to the syntheses described by D. Heber et al., *Arzneim-Forsch*, **44**, 809 (1994) starting with 2-aminopyridines or substituted derivatives thereof.

[097] The 2-aminopyridines may be obtained by applying or adapting the methods described in "The Chemistry of Heterocyclic Compounds", Vol. 14, *Pyridine and its Derivatives, Supplement Part III*, page 41, Ed. R. A. Abramovitch, Interscience Publication.

[098] The derivatives of general formula (III) for which Hal is a bromine atom,  $R_1$  is defined as above and  $X_5$  represents a nitrogen atom may be obtained from 2-amino-benzenamides as described in *J. Am. Chem. Soc.*, **69**, 184 (1947). 2-Amino-benzenamide is cyclized in the presence of an

alkyl orthoformate such as ethyl orthoformate in a solvent such as diethylene glycol at a temperature of between 105°C and 120°C to give 4-hydroxyquinazoline, which is brominated as described above. The 2-aminobenzenamide is obtained from the corresponding aniline by applying or adapting the methods described by V. Snieckus, *Chem. Rev.*, **90**, 879 (1990) and *Pure Appl. Chem.*, **62**, 2047 (1990).

[099] The heterocyclic derivatives of general formula (III) for which Hal is a bromine atom, R<sub>1</sub> is defined as above and X<sub>4</sub> is a nitrogen atom may be obtained from 2-acetylaniline as described in *Synth. Commun.*, **19**, 3087 (1989). The 4-hydroxycinnoline obtained is brominated under the conditions described above. The 2-acetylanilines are obtained from the corresponding aniline by applying the methods cited above for 2-aminobenzenamide.

[0100] The piperidine derivatives of general formula (IV) for which n = 0 and R''<sub>2</sub> represents carboxyl may be prepared from the corresponding piperidine derivative of general formula:

[0101]

[0102] in which R''<sub>2</sub> defined as above is protected beforehand and Rz is defined as above, by analogy with the

studies of Koppel, *J. Chem. Soc. Chem. Commun.*, 473 (1975) by reaction between the piperidine derivative and vinyl phenyl sulfoxide in the presence of a base (for example sodium hydride, lithium diisopropylamide or lithium hexamethyldisilylamide) in a solvent such as an ether (for example tetrahydrofuran) at a temperature of between 0°C and 100°C. The intermediate adduct obtained is then thermolyzed at between 60°C and 150°C in an inert solvent (for example chloroform, tetrahydrofuran, toluene or xylene). R<sub>z</sub> is advantageously a protecting group for the nitrogen atom such as, for example, t-butyloxycarbonyl.

[0103] The piperidine derivatives of general formula (IV) for which  $n = 1$  or  $2$  and R<sub>2</sub> represents carboxyl may be prepared from the corresponding piperidine derivative of general formula (V) for which R<sub>2</sub> is protected beforehand, according to or by analogy with the methods described below in the examples. In particular, the process is performed by the successive action of a base such as, for example, lithium diisopropylamide or n-butyllithium, in a solvent such as an ether (for example tetrahydrofuran) at a temperature of between -80°C and 0°C, and then of an alkenyl halide (allyl halide or 1-halo-3-butene).

[0104] The piperidine derivatives of general formula (IV) for which  $n$  is defined as above and R<sub>2</sub> is

alkyloxycarbonyl, cycloalkyloxycarbonyl,  $\text{-CO-NRaRb}$ ,  
 alkyloxycarbonylmethyl, alkyloxycarbonylethyl,  
 cycloalkyloxycarbonylmethyl, cycloalkyloxycarbonylethyl,  
 $\text{-CH}_2\text{-CONRaRb}$ , or  $\text{-(CH}_2\text{)}_2\text{-CONRaRb}$  or for which  $\text{Rc}$  in  $\text{R}_2$   
 represents alkyloxycarbonyl, cycloalkyloxycarbonyl or  
 $\text{-CO-NRaRb}$  may be prepared from the corresponding carboxylic  
 acid derivative, according to the usual methods for converting  
 into ester or amide which do not affect the rest of the  
 molecule. The esters are prepared in the presence of a  
 coupling agent such as a carbodiimide (for example  $\text{(N,N'-}$   
 $\text{dicyclocarbodiimide)}$  or  $\text{N,N'-carbonyldiimidazole}$  in an ether  
 (for example tetrahydrofuran or dioxane), an amide (for  
 example dimethylformamide) or a chlorinated solvent (for  
 example dichloromethane, 1,2-dichloroethane or chloroform), at  
 a temperature of between  $0^\circ\text{C}$  and the reflux temperature of the  
 reaction mixture. The amides are prepared by the action of  
 the corresponding amine under conditions identical to those  
 described above. In particular also, when it involves the  
 preparation of a derivative for which  $\text{Rc}$  in  $\text{R}_2$  is an ester, by  
 analogy with the methods described by Saha et al., *J. Chem.*  
*Soc. Perkin I*, 505 (1985), by the action of a diazoalkane (for  
 example diazomethane) in an ether (for example diethyl ether)  
 at a temperature of between  $-10^\circ\text{C}$  and  $5^\circ\text{C}$ .

[0105] The piperidine derivatives of general formula (IV) for which n is defined as above and R''<sub>2</sub> represents cyano, -CH<sub>2</sub>-CN, or -(CH<sub>2</sub>)<sub>2</sub>-CN may be prepared from the corresponding amides by the action of a dehydrating agent, by adapting the method described by Bieron et al., Zabicky "The Chemistry of Amides," Wiley, pp. 274-283 (1970). The reaction is carried out in the presence of phosphorus pentoxide or phosphorus oxychloride with or without solvent, at a temperature of between 20°C and the reflux temperature of the reaction mixture.

[0106] The piperidine derivatives of general formula (IV) for which n is defined as above and R''<sub>2</sub> represents hydroxymethyl, cyanomethyl or carboxymethyl may be prepared from the piperidine derivative of general formula:

[0107]

[0108] in which Rz and n are defined as above, and Ry represents a readily hydrolyzable protecting radical, in particular, by the action of a hydride (for example lithium aluminum hydride or diisobutylaluminum hydride) in a solvent such as an ether (for example tetrahydrofuran) at a temperature of between 20°C and 60°C to prepare the piperidine

derivative for which  $R''_2$  is hydroxymethyl, followed by converting the hydroxymethyl radical into a cyanomethyl radical and then a carboxymethyl radical according to the usual methods which do not affect the rest of the molecule.

[0109] When  $R_y$  represents a readily hydrolyzable radical, it may be chosen especially from alkyl (1 to 4 carbon atoms in a straight or branched chain), benzyl, cycloalkyl, phenylpropyl, and allyl.

[0110] The conversion into acid may be carried out in particular from the latter compound, by the action of a halogenating agent such as, for example, thionylchloride or phosphorus trichloride or tribromide or by the action of an alkanesulfonyl chloride (for example methanesulfonyl chloride or p-toluenesulfonyl chloride) in an inert solvent (for example dichloromethane), followed by the action of an alkaline cyanide (for example potassium cyanide or sodium cyanide) and hydrolysis. The halogenation reaction is carried out in a chlorinated solvent (for example dichloromethane or chloroform), at a temperature of between  $0^\circ\text{C}$  and the reflux temperature of the reaction mixture. The reaction of the alkaline cyanide may be carried out in dimethyl sulfoxide, an amide (for example dimethylformamide), a ketone (for example acetone), an ether (for example tetrahydrofuran) or an alcohol (for example methanol or ethanol), at a temperature of between

20°C and the reflux temperature of the reaction mixture. The nitrile is hydrolyzed according to the conventional methods which do not affect the rest of the molecule, especially by the action of hydrochloric acid in methanolic medium, at a temperature of between 20°C and 70°C, followed by saponification of the ester obtained (for example with sodium hydroxide in a mixture of dioxane and water), or directly by the action of aqueous sulfuric acid at a temperature of between 50°C and 80°C.

[0111] The piperidine derivatives of general formula (IV) for which  $n$  and  $R_z$  are defined as above and  $R''_2$  represents a 2-carboxyethyl radical may be prepared from the derivative of general formula (IV) for which  $R''_2$  represents a hydroxymethyl radical via the halo derivative (prepared as described above) and then coupling with the sodium salt of diethyl malonate followed by acidic hydrolysis in aqueous medium of the product obtained.

[0112] The piperidine derivatives of general formula (IV) for which  $n$  and  $R_z$  are defined as above and  $R''_2$  represents carboxyhydroxymethyl or carboxycarbonyl may be prepared by homologation of the piperidine derivative of general formula:

[0113]

[0114] in which Rz and n are defined as above, by applying or adapting the methods described by M. Mizuno et al., *Tetrahedron Lett.* **39**, 9209 (1998). The reaction is carried out by the action of a dialkyl phosphorocyanidate (for example diethyl phosphorocyanidate) in the presence of an organic base (for example triethylamine) in an ether (for example tetrahydrofuran) at a temperature of between  $-50^\circ\text{C}$  and  $10^\circ\text{C}$ . The intermediate dicyanophosphate obtained is then hydrolyzed in acidic medium (for example concentrated hydrochloric acid) in a polar solvent (for example water) at the reflux temperature of the reaction mixture. The derivatives for which  $\text{R}''_2$  is carboxycarbonyl are obtained by oxidation of the corresponding ester, by adapting the methods described by Burhardt et al., *Tetrahedron Lett.*, **29**, 3433 (1988) followed by hydrolysis of the product obtained. In particular by the action of an oxidizing agent such as triacetoxy-1,1-dihydro-1,2-benziodoxol-3(1H)one in a solvent such as a nitrile or a chlorinated derivative (for example acetonitrile or dichloromethane) at a temperature of between

0°C and 40°C, followed by hydrolysis by the action of a base (for example sodium hydroxide) in an aqueous-alcoholic solvent (for example water-methanol) at a temperature of between 20°C and the reflux temperature of the reaction mixture.

[0115] The piperidine derivatives of general formula (IV) for which  $n$  and  $R_z$  are defined as above and  $R''_2$  represents  $-CF_2-R_c$  may be prepared by the action of a fluorinating agent on a piperidine derivative of general formula (IV) for which  $R''_2$  is a radical  $-CO-R_c$ ,  $R_c$  being an ester, by analogy with the methods described by M. Parisi et al., *J. Org. Chem.*, **60**, 5174 (1995), optionally followed by hydrolysis of the ester if it is desired to obtain a piperidine derivative for which  $R_c$  is carboxyl. The fluorinating conditions are similar to those described above for the preparation of derivatives for which  $R_e$  in  $Y$  is a fluorine atom. The hydrolysis is carried out by the action of a base in an aqueous-alcoholic solvent under the conditions described above.

[0116] The piperidine derivatives of general formula (IV) for which  $n$  and  $R_z$  are defined as above and  $R''_2$  represents a radical  $-CH=CH-R_c$  may be prepared by oxidation to aldehyde of the derivative of general formula (IV) for which  $R''_2$  represents a hydroxymethyl radical by adapting the methods described in *Org. Synth. Coll.*, Vol. II, p. 541, *Coll. Vol. 5*, p. 242, followed by conversion to a derivative for which  $R''_2$  is

-CH=CH-Rc in which Rc is an ester, by applying the Wittig method optionally followed by hydrolysis of the ester obtained to an acid. The oxidation is carried out by the action of an oxidizing agent (for example potassium dichromate) in acidic medium (for example sulfuric acid) in a polar solvent (for example water) or chromium oxide in the presence of a base (for example pyridine) in a chlorinated solvent (for example dichloromethane) at a temperature of between 0°C and 20°C. The conversion to an unsaturated derivative is carried out by adapting the methods described by Johnson in "Ylid Chemistry," Academic Press (1966) by the action of a phosphorus ylid (for example carbethoxymethylene-triphenylphosphorane) in a hydrocarbon (for example toluene) at a temperature of between 60°C and the reflux temperature of the reaction mixture. The hydrolysis is carried out according to the methods described above.

[0117] The piperidine derivatives of general formula (IV) for which n and Rz are defined as above and R<sub>2</sub> represents a radical C(CH<sub>3</sub>)<sub>2</sub>Rc or -C(cycloalk)Rc may be prepared from a derivative of general formula (IV) for which R<sub>2</sub> is an ester of the acid for which R<sub>2</sub> is -CH<sub>2</sub>COOH by adapting the methods described by Ashutosh et al., *Tetrahedron Lett.*, **40**, 4733 (1999) and Sauers, *J. Org. Chem.*, **57**, 671 (1992) optionally followed by hydrolysis of the ester obtained. The reaction is

carried out in particular by the successive action of an amide (for example lithium diisopropylamide) followed by a methyl halide (for example methyl iodide) or a derivative of formula Hal-Alk-Hal (Hal in one embodiment being a bromine atom) in a polar solvent (for example hexamethylphosphorotriamide) at a temperature of between 0°C and 60°C.

[0118] It is understood that the processes listed above for the preparation of the piperidine derivatives of general formula (IV) may also be applied to the derivatives of general formula (II) if optionally first one couples the piperidine with the heterocyclic derivative of general formula (III) and then converts the radical R<sub>2</sub> under the conditions described above.

[0119] It is also understood that the methods described below in the examples also form part of the present invention.

[0120] It is understood that the derivatives of general formulae (I) and (II) may exist in enantiomeric or diastereoisomeric forms or in syn or anti form. The enantiomeric or diastereoisomeric and syn or anti forms and the mixtures thereof also fall within the context of the present invention. These forms may be separated according to the usual methods, especially by chromatography on silica or by high performance liquid chromatography (HPLC).

[0121] The heterocyclalalkylpiperidine derivatives of general formula (I) may be purified, where appropriate, by physical methods such as crystallization or chromatography.

[0122] The heterocyclalalkylpiperidine derivatives of general formula (I) may, where appropriate, be converted into addition salts with acids, by the known methods. It is understood that these salts also fall within the context of the present invention.

[0123] As examples of addition salts with pharmaceutically acceptable acids, mention may be made of the salts formed with mineral acids (hydrochlorides, hydrobromides, sulfates, nitrates and phosphates) or with organic acids (succinates, fumarates, tartrates, acetates, propionates, maleates, citrates, methanesulfonates, ethanesulfonates, phenylsulfonates, p-toluenesulfonates, isethionates, naphthylsulfonates or camphorsulfonates, or with substitution derivatives of these compounds).

[0124] Some of the heterocyclalalkylpiperidine derivatives of general formula (I) bearing a carboxyl radical may be converted into metal salts or into addition salts with nitrogen bases according to the methods that are known per se. These salts also fall within the context of the present invention. The salts may be obtained by the action of a metallic base (for example an alkali metal or alkaline-earth

metal), ammonia or an amine, on a product according to the invention, in a suitable solvent such as an alcohol, an ether or water, or by exchange reaction with a salt of an organic acid. The salt formed precipitates after optional concentration of the solution, and is separated out by filtration, settling or freeze-drying.

[0125] Examples of pharmaceutically acceptable salts which may be mentioned are the salts with alkali metals (sodium, potassium or lithium) or with alkaline-earth metals (magnesium or calcium), the ammonium salts or the salts of nitrogen bases (ethanolamine, diethanolamine, trimethylamine, triethylamine, methylamine, propylamine, diisopropylamine, N-N-dimethylethanolamine, benzylamine, dicyclohexylamine, N-benzyl- $\beta$ -phenethylamine, N,N'-dibenzylethylenediamine, diphenylenediamine, benzhydrylamine, quinine, choline, arginine, lysine, leucine or dibenzylamine).

[0126] The heterocyclalkylpiperidine derivatives according to the invention are particularly advantageous antibacterial agents.

[0127] *In vitro*, the heterocyclalkylpiperidine derivatives according to the invention have been found to be active on gram-positive microorganisms at concentrations of between 0.03  $\mu\text{g/ml}$  and 4  $\mu\text{g/ml}$  on meticillin-resistant *Staphylococcus aureus* AS5155, and also, for most of them, at

concentrations of between 0.03 µg/ml and 8 µg/ml on *Streptococcus pneumoniae* 6254-01; they have also been found to be active on gram-negative microorganisms such as, for example, and in a nonlimiting manner, on *Moraxella catarrhalis* IPA 152, at concentrations of between 0.12 µg/ml and 64 µg/ml.

*In vivo*, they have been found to be active on experimental infections of mice with *Staphylococcus aureus* IP8203, either subcutaneously at doses of between 18 mg/kg and 150 mg/kg (DC<sub>50</sub>), or orally at doses of between 20 mg/kg and 150 mg/kg.

[0128] Finally, the products according to the invention are particularly advantageous on account of their low toxicity. None of the products has shown any toxicity subcutaneously at the dose of 100 mg/kg in mice (two administrations).

[0129] In the general formula (I), the products for which

[0130]  $X_1, X_2, X_3, X_4$  and  $X_5$  represent, respectively,  $>C-R'_1$  to  $>C-R'_5$ , or alternatively not more than one of them represents a nitrogen atom,

[0131]  $R_1, R'_1, R'_2, R'_3, R'_4$  and  $R'_5$  are identical or different and represent a hydrogen or halogen atom or an alkyl or alkyloxy radical, or represent a methylene radical substituted with alkyloxy,

[0132]  $R_2$  represents carboxyl, alkyloxycarbonyl or -CONRaRb (for which Ra represents a hydrogen atom and Rb represents a hydrogen atom or a hydroxyl radical) or

[0133]  $R_2$  represents hydroxymethyl, alkyl containing 1 or 2 carbon atoms substituted with carboxyl or alkyloxy-carbonyl,

[0134]  $R_3$  represents a radical  $\text{alk-R}_3^\bullet$  for which alk is an alkyl radical and  $R_3^\bullet$  represents hydrogen, cycloalkyl, cycloalkylthio, phenyl, phenoxy, phenylthio, phenylamino, heterocyclyloxy or heterocyclylthio or alternatively  $R_3^\bullet$  represents  $-\text{CR}'\text{b}=\text{CR}'\text{c}-\text{R}'\text{a}$  for which R'a represents phenyl, and for which R'b and R'c represent hydrogen,

[0135] Y represents a radical  $>\text{CH-Re}$  for which Re is hydrogen, fluoro or hydroxyl,

[0136] n is an integer from 2 to 3,

[0137] it being understood that the phenyl or heterocyclyl radicals or portions mentioned above may be optionally substituted on the ring with 1 to 4 halogens.

[0138] Of special interest are the heterocyclylalkyl piperidine derivatives of general formula (I) mentioned below:

[0139] 4-[3-(3-Chloro-6-methoxyquinolin-4-yl)propyl]-1-[2-(thien-2-yl)thioethyl]piperidine-4-carboxylic acid

[0140] 4-[3-(3-Chloro-6-methoxyquinolin-4-yl)propyl]-1-[2-(3,5-difluorophenoxy)ethyl]piperidine-4-carboxylic acid

[0141] 4-[3-(3-Chloro-6-methoxyquinolin-4-yl)propyl]-  
1-(2-thiazol-2-thioethyl)piperidine-4-carboxylic acid

[0142] 1-(2-Cyclopentylthioethyl)-4-[3-(3-fluoro-6-  
methoxyquinolin-4-yl)propyl]piperidine-4-carboxylic acid

[0143] 4-[3-(3-Fluoro-6-methoxyquinolin-4-yl)propyl]-  
1-(3-phenylallyl)piperidine-4-carboxylic acid

[0144] and also the salts thereof.

[0145] Among the products according to the invention  
that may be mentioned are the heterocyclalalkylpiperidine  
derivatives of general formula (I), the names of which follow:

[0146] 4-[3-(3-Chloro-6-methoxyquinolin-4-yl)propyl]-1-  
heptylpiperidine-4-carboxylic acid

[0147] 4-[3-(3-Chloro-6-methoxyquinolin-4-yl)propyl]-1-  
[4-phenylbutyl]piperidine-4-carboxylic acid

[0148] 4-[3-(3-Chloro-6-methoxyquinolin-4-yl)propyl]-1-  
[4-(2-fluorophenyl)propyl]piperidine-4-carboxylic acid

[0149] 4-[3-(3-Chloro-6-methoxyquinolin-4-yl)propyl]-1-  
[4-(3-fluorophenyl)propyl]piperidine-4-carboxylic acid

[03393] The examples which follow, given in a non-limiting manner, illustrate the present invention.

**Example 1**

[03394] 4-[3-(3-Chloro-6-methoxyquinolin-4-yl)propyl]-1-[2-(thien-2-yl)thioethyl]-piperidine-4-carboxylic acid dihydrochloride.

[03395] A mixture of 0.6 g of benzyl 4-[3-(3-chloro-6-methoxyquinolin-4-yl)propyl]-1-[2-(thien-2-yl)thioethyl]-piperidine-4-carboxylate in 7.72 cm<sup>3</sup> of aqueous 6N hydrochloric acid was maintained at a temperature in the region of 100°C with stirring and under an inert atmosphere for 2 hours. After cooling to about 20°C, the reaction mixture was concentrated to dryness under reduced pressure (5 kPa) at a temperature in the region of 40°C.

[03396] The residue obtained was taken up in 10 cm<sup>3</sup> of a dichloromethane/methanol mixture (90/10 by volume). The mixture was concentrated to dryness under the above conditions. 0.58 g of 4-[3-(3-chloro-6-methoxyquinolin-4-yl)propyl]-1-[2-(thien-2-yl)thioethyl]piperidine-4-carboxylic acid dihydrochloride, was obtained in the form of a beige-colored foam melting at 130°C with decomposition.

[03398] **Benzyl 4-[3-(3-chloro-6-methoxyquinolin-4-yl)propyl]-1-[2-(thien-2-yl)thioethyl]-piperidine-4-carboxylate**

[03399] A mixture of 0.6 g of benzyl 4-[3-(3-chloro-6-methoxyquinolin-4-yl)propyl]piperidine-4-carboxylate, 0.36 g of 2-(2-bromoethylthio)thiophene and 0.22 g of potassium carbonate in 20  $\text{cm}^3$  of acetonitrile was heated for 16 hours at a temperature in the region of 80°C, with stirring and under an inert atmosphere. After cooling to a temperature in the region of 20°C, the reaction mixture was concentrated under reduced pressure (5 kPa) at a temperature in the region of 40°C.

[03400] A residue was obtained, which was purified by chromatography, under a nitrogen pressure of 100 kPa, on a column of silica gel (particle size 40-63  $\mu$ ; diameter 3.5 cm; height 28 cm), eluting with a mixture of dichloromethane/methanol (97.5/2.5 by volume) and collecting

35-cm<sup>3</sup> fractions. Fractions 15 to 20 were combined and then concentrated to dryness under the above conditions. 0.67 g of benzyl 4-[3-(3-chloro-6-methoxyquinolin-4-yl)propyl]-1-[2-(thien-2-yl)thioethyl]piperidine-4-carboxylate was obtained in the form of an orange-colored viscous oil.

[03402] **Benzyl 4-[3-(3-chloro-6-methoxyquinolin-4-yl)propyl]piperidine-4-carboxylate**

[03403] 1.27 cm<sup>3</sup> of trifluoroacetic acid were added, with stirring and under an inert atmosphere, at a temperature in the region of 20°C, to a solution of 2.05 g of benzyl 4-[3-(3-chloro-6-methoxyquinolin-4-yl)propyl]-1-(tert-butyloxycarbonyl)piperidine-4-carboxylate in 50 cm<sup>3</sup> of dichloromethane. After 30 minutes, a further 1.27 cm<sup>3</sup> of trifluoroacetic acid were added and, after a further 30 minutes, a further 1.27 cm<sup>3</sup> were added. The reaction was completed by a final addition of 1.27 cm<sup>3</sup> of trifluoroacetic acid. After one hour, the reaction mixture was concentrated under reduced pressure (5 kPa) at a temperature in the region of 40°C.

[03404] The evaporation residue was taken up in 50 cm<sup>3</sup> of ethyl acetate and 20 cm<sup>3</sup> of water. After addition of 5 g of potassium carbonate and stirring for 5 minutes, phases were

allowed to separate by settling and the organic phase separated out was washed with twice 10 cm<sup>3</sup> of distilled water and then with 20 cm<sup>3</sup> of aqueous 10% (by weight) sodium chloride solution. After drying over magnesium sulfate and then filtration, the organic solution was concentrated under reduced pressure (5 kPa) at a temperature in the region of 40°C.

[03405] The residue obtained was purified by chromatography, under a nitrogen pressure of 100 kPa, on a column of silica gel (particle size 40-63 μ; diameter 3.5 cm; height 30 cm), eluting with a mixture of dichloromethane/methanol/32% aqueous ammonia (89/10/1 by volume), and collecting 40-cm<sup>3</sup> fractions. Fractions 14 to 23 were combined and then concentrated to dryness under the above conditions. 1.36 g of benzyl 4-[3-(3-chloro-6-methoxyquinolin-4-yl)propyl]piperidine-4-carboxylate were obtained in the form of a beige-colored solid melting at 95°C.

[03407] **Benzyl 4-[3-(3-chloro-6-methoxyquinolin-4-yl)propyl]-1-(tert-butyloxycarbonyl)-piperidine-4-carboxylate.**

[03408] 1.98 g of benzyl 4-allyl-1-(tert-butyloxycarbonyl)-piperidine-4-carboxylate were cooled to a temperature in the region of -30°C and 11.32 cm<sup>3</sup> of a 0.5M

solution of 9-borabicyclo[3.3.1]nonane in tetrahydrofuran were added with stirring and under an inert atmosphere. After the addition, the temperature of the mixture was brought to about 20°C. The solution obtained was stirred for a further 4 hours, followed by addition of 40 cm<sup>3</sup> of dioxane, 0.183 g of diphenylphosphinoferrocenepalladium chloride, 2 g of 4-bromo-3-chloro-6-methoxyquinoline and 3.0 g of tribasic potassium phosphate. After stirring for 16 hours at a temperature in the region of 60°C, the reaction mixture was cooled to about 20°C and then filtered. The insoluble material was washed with 3 times 20 cm<sup>3</sup> of ethyl acetate and the filtrate and washing waters were then combined and stirred with 40 cm<sup>3</sup> of water and 100 cm<sup>3</sup> of ethyl acetate. The organic phase was separated out by settling, washed with twice 20 cm<sup>3</sup> of water and then with 40 cm<sup>3</sup> of aqueous 10% (by weight) sodium chloride solution, dried over magnesium sulfate, filtered and concentrated under reduced pressure (5 kPa) at a temperature in the region of 40°C.

[03409] The residue obtained was purified by chromatography, under a nitrogen pressure of 100 kPa, on a column of silica gel (particle size 40-63 µ; diameter 3.5 cm; height 30 cm), eluting with a mixture of dichloromethane/methanol (98.5/1.5 by volume) and collecting 35-cm<sup>3</sup> fractions. Fractions 22 to 29 were combined and then

concentrated under the above conditions. 2.09 g of benzyl 4-[3-(3-chloro-6-methoxyquinolin-4-yl)propyl]-1-(tert-butyloxycarbonyl)piperidine-4-carboxylate were obtained in the form of a thick yellow oil.

[03410] Infra-red spectrum ( $\text{CCl}_4$ ) 2930; 1728; 1695; 1622; 1503; 1230; 1172; 833 and  $697\text{ cm}^{-1}$ .

[03411] **Benzyl 4-allyl-1-(tert-butyloxycarbonyl)piperidine-4-carboxylate.**

[03412] 15.4 g of potassium carbonate and then  $10.6\text{ cm}^3$  of benzyl bromide were added, at a temperature in the region of  $20^\circ\text{C}$ , with stirring and under an inert atmosphere, to a solution of 20 g of 4-allyl-1-(tert-butyloxycarbonyl)-piperidine-4-carboxylic acid in  $200\text{ cm}^3$  of dimethylformamide. The mixture was stirred for 16 hours at about  $20^\circ\text{C}$  and then filtered. The insoluble material was washed with twice  $100\text{ cm}^3$  of ethyl acetate. The filtrate and the washing waters were combined,  $250\text{ cm}^3$  of water were added and the mixture was then extracted once with  $500\text{ cm}^3$  and once with  $150\text{ cm}^3$  of ethyl acetate. The organic extracts were combined, washed with twice  $125\text{ cm}^3$  of aqueous 10% (by weight) sodium chloride solution, dried over magnesium sulfate, filtered and concentrated under reduced pressure (5 kPa) at a temperature in the region of  $40^\circ\text{C}$ .

[03413] An oil was obtained, which was purified by chromatography, under a pressure of 100 kPa of nitrogen, on a column of silica gel (particle size 40-63  $\mu$ ; diameter 7 cm; height 30 cm), eluting with a mixture of dichloromethane/methanol (99/1 by volume) and collecting 200- $\text{cm}^3$  fractions. Fractions 6 to 16 were combined and concentrated to dryness under reduced pressure (5 kPa) at a temperature in the region of 40°C. 25 g of benzyl 4-allyl-1-(*tert*-butyloxycarbonyl)piperidine-4-carboxylate were obtained in the form of a pale yellow liquid.

[03414] Infra-red spectrum ( $\text{CH}_2\text{Cl}_2$ ): 2980; 1725; 1683; 1426; 1171; 1142; 974 and 924  $\text{cm}^{-1}$ .

[03415] **4-Allyl-1-(*tert*-butyloxycarbonyl)piperidine-4-carboxylic acid.**

[03416] 4.44  $\text{cm}^3$  of water and then 30.62 g of ethyl 4-allyl-1-(*tert*-butyloxycarbonyl)-piperidine-4-carboxylate predissolved in 150  $\text{cm}^3$  of tetrahydrofuran were added, with stirring and under an inert atmosphere, to a mixture of 48.52 g of potassium *tert*-butoxide in 350  $\text{cm}^3$  of tetrahydrofuran, cooled to a temperature in the region of 0°C. After allowing the temperature to return to the region of 20°C, the mixture was stirred for 24 hours at this temperature. 300  $\text{cm}^3$  of ice-cold water were added to the reaction mixture and the mixture was then concentrated to dryness under reduced pressure

(5 kPa) at a temperature in the region of 40°C. The aqueous residue was extracted with 300 cm<sup>3</sup> of diethyl ether. After leaving to stand for 16 hours, the aqueous phase was acidified at a pH in the region of 3-4 by addition of about 215 cm<sup>3</sup> of aqueous hydrochloric acid, and was then extracted with three times 300 cm<sup>3</sup> of diethyl ether.

[03417] The ether extracts were combined, dried over magnesium sulfate, filtered and concentrated to dryness under reduced pressure (5 kPa) at a temperature in the region of 40°C. 26.1 g of 4-allyl-1-(tert-butyloxycarbonyl)piperidine-4-carboxylic acid were obtained in the form of an off-white solid.

[03419] **Ethyl allyl-1-(tert-butyloxycarbonyl)piperidine-4-carboxylate.**

[03420] 70 cm<sup>3</sup> of a solution of butyllithium in hexane (2.5M concentration) were added, with stirring and under an inert atmosphere, to 150 cm<sup>3</sup> of tetrahydrofuran cooled to a temperature in the region of -70°C, followed by addition of 50 cm<sup>3</sup> of tetrahydrofuran and 23 cm<sup>3</sup> of diisopropylamine predissolved in 300 cm<sup>3</sup> of tetrahydrofuran. After a further addition of 50 cm<sup>3</sup> of tetrahydrofuran, the mixture was stirred for 15 minutes at about -70°C, followed by addition of 45.15 g

of ethyl de 1-(tert-butyloxycarbonyl)isonipeccate predissolved in 400 cm<sup>3</sup> of tetrahydrofuran, and finally 50 cm<sup>3</sup> of this same solvent. After stirring the mixture for 1 hour at a temperature in the region of -70°C, 16.7 cm<sup>3</sup> of allyl bromide predissolved in 150 cm<sup>3</sup> of tetrahydrofuran were added and the mixture was then warmed to about 20°C and stirred for 17 hours. The mixture was poured into 200 cm<sup>3</sup> of saturated aqueous ammonium chloride solution and then extracted with about 2 liters of ethyl acetate.

[03421] The combined extracts were dried over sodium sulfate, filtered and concentrated under reduced pressure (5 kPa) at a temperature in the region of 40°C. An oil was obtained, which was purified by chromatography, under a nitrogen pressure of 100 kPa, on a column of silica gel (diameter 12 cm; height 50 cm), eluting with a mixture of dichloromethane/methanol (99.5/0.5 by volume) and collecting 200-cm<sup>3</sup> fractions. Fractions 20 to 84 were combined and concentrated under reduced pressure (5 kPa) at a temperature in the region of 40°C. 27.85 g of ethyl 4-allyl-1-(tert-butyloxycarbonyl)-piperidine-4-carboxylate were obtained in the form of a yellow oil.

[03424] 88.3 cm<sup>3</sup> of triethylamine were added over 1 hour, with stirring and under an inert atmosphere, to a solution of 100 g of ethyl isonipecotate in 1500 cm<sup>3</sup> of dichloromethane cooled to a temperature in the region of 5°C, followed, over the same time, by addition of 166.6 g of di-tert-butyl dicarbonate predissolved in 300 cm<sup>3</sup> of dichloromethane. The reaction mixture was stirred for 16 hours while allowing the temperature to return to the region of 20°C. After a further addition of 41.6 g of di-tert-butyl dicarbonate dissolved in 70 cm<sup>3</sup> of dichloromethane, the reaction mixture was stirred for 3 hours at about 20°C and then washed with twice 600 cm<sup>3</sup> of saturated aqueous sodium chloride solution, dried over sodium sulfate, filtered and concentrated under reduced pressure (5 kPa) at a temperature in the region of 40°C. 171 g of ethyl 1-(tert-butyloxycarbonyl)isonipecotate were obtained in the form of a brown oil.

[03427]     **4-Bromo-3-chloro-6-methoxyquinoline.**

[03428]     A mixture of 20 g of 3-chloro-4-hydroxy-6-methoxyquinoline in 1000 cm<sup>3</sup> of acetonitrile, to which was added 80.8 g of triphenylphosphine bromide, was stirred for 2 hours 30 minutes at a temperature in the region of 85°C. The solution obtained was cooled to the region of 20°C and then stirred for 16 hours at this same temperature. The reaction mixture was concentrated under reduced pressure (5 kPa) at a temperature in the region of 40°C and the evaporation residue was then taken up in 200 cm<sup>3</sup> of saturated aqueous sodium hydrogen carbonate solution and 200 cm<sup>3</sup> of ethyl acetate.

[03429]     The organic phase was separated out after settling has taken place and was washed with twice 200 cm<sup>3</sup> of distilled water. The aqueous phase was extracted once more with ethyl acetate and the organic extracts were then combined, dried over magnesium sulfate, filtered and concentrated under reduced pressure (5 kPa) at a temperature in the region of 40°C. A product was obtained, which was purified by chromatography under a nitrogen pressure of 100 kPa, on a column of silica gel (diameter 7.5 cm; mass of silica 700 g), eluting with a mixture of cyclohexane/ethyl acetate (70/30 by volume). The fractions corresponding to the expected product were collected.

[03430] These fractions were combined and then concentrated under the same conditions as above. 20.7 g of 4-bromo-3-chloro-6-methoxyquinoline were obtained in the form of a white solid melting at 108°C.

[03433] 14.26 g of N-chlorosuccinimide were added, at a temperature in the region of 20°C and with stirring, to a mixture of 17 g of 4-hydroxy-6-methoxyquinoline in 700 cm<sup>3</sup> of acetic acid and the mixture was then heated at a temperature of between 50 and 70°C for 4 hours. The solution obtained was subsequently cooled to about 20°C and then concentrated to dryness under reduced pressure (5 kPa) at a temperature in the region of 40°C.

[03434] The solid residue was taken up in 250 cm<sup>3</sup> of saturated aqueous sodium hydrogen carbonate solution. The mixture was stirred for 1 hour. The insoluble material was filtered off and washed with 3 times 250 cm<sup>3</sup> of water. The crystals obtained were dried under reduced pressure (10 Pa) for 3 hours at a temperature in the region of 20°C. 20 g of 3-chloro-4-hydroxy-6-methoxyquinoline were obtained in the form of a yellow solid.

[03635] 3.9 g of ethyl 4-[3-(3-chloro-6-methoxyquinolin-4-yl)propyl]piperidine-4-carboxylate and 2.07 g of potassium carbonate were added to a solution of 1.17 cm<sup>3</sup> of 2-iodoethanol in 80 cm<sup>3</sup> of acetonitrile, at a temperature in the region of 20°C with stirring and under an inert atmosphere. After heating for 23 hours at a temperature in the region of 80°C, a further 1.17 cm<sup>3</sup> of 2-iodoethanol were added. After heating for 40 hours at a temperature in the region of 80°C, the reaction mixture was cooled to about 20°C, filtered and concentrated under reduced pressure (1 kPa) at a temperature in the region of 50°C. The residue obtained was purified by chromatography under a pressure of 100 kPa of

nitrogen, on a column of silica gel (particle size 40-60  $\mu$ ; diameter 4 cm; height 60 cm), eluting with a dichloromethane/methanol/aqueous ammonia mixture (89/10/1 by volume) and collecting 50-cm<sup>3</sup> fractions. Fractions 14 to 17 were combined and then concentrated as previously. 1.9 g of ethyl 4-[3-(3-chloro-6-methoxyquinolin-4-yl)propyl]-1-(2-hydroxyethyl)piperidine-4-carboxylate were obtained.

[03637] **4-[3-(R,S)-Hydroxy-3-(3-chloro-6-methoxyquinolin-4-yl)propyl]-1-[2-(cyclopentylthioethyl)piperidin-4-yl]methanol dihydrochloride**

[03638] A mixture of 0.6 g of {4-[3-(3-chloro-6-methoxyquinolin-4-yl)-3-(R,S)-hydroxypropyl]piperidin-4-yl}methanol dihydrochloride, 0.24 g of 1-bromo-2-(cyclopentylthio)ethyl, 0.22 g of potassium iodide and 0.9 g of potassium carbonate in 25 cm<sup>3</sup> of acetonitrile was heated with stirring for 20 hours at a temperature in the region of 75°C. After cooling to a temperature in the region of 20°C, the reaction mixture was concentrated to dryness under reduced pressure (2 kPa) at a temperature in the region of 40°C.

[03639] The residue obtained was taken up in 20 cm<sup>3</sup> of water and then extracted with 3 times 20 cm<sup>3</sup> of ethyl acetate.

The organic phases were combined, dried over magnesium sulfate, filtered and then concentrated to dryness as above. The residue obtained was purified by chromatography under a pressure of 50 kPa of nitrogen, on a column of silica gel (particle size 20-45  $\mu$ ; diameter 3 cm; height: 18 cm), eluting with a dichloromethane/methanol mixture (90/10 by volume). The fractions containing the expected product were combined and then concentrated to dryness under the above conditions. The residue obtained was taken up in 5 cm<sup>3</sup> of acetone and then acidified with 3 cm<sup>3</sup> of a 1N solution of hydrogen chloride in diethyl ether. The suspension obtained was diluted with 20 cm<sup>3</sup> of diethyl ether, stirred at a temperature in the region of 20°C for 3 hours, filtered, washed with diethyl ether and then dried in a desiccator under reduced pressure (0.1 kPa) at a temperature in the region of 40°C. 0.4 g of 4-[3-(R,S)-hydroxy-3-(3-chloro-6-methoxyquinolin-4-yl)propyl]-1-[2-(cyclopentylthioethyl)piperidin-4-yl]methanol dihydrochloride was obtained in the form of a pale yellow solid melting at 120°C.

[03734] 0.47 cm<sup>3</sup> of thionyl chloride was added dropwise, with stirring and under an inert atmosphere, to a mixture of 1.1 g of 3-(3-chloro-6-methoxyquinolin-4-yl)-9-[2-(3,5-difluorophenoxy)ethyl]-2-oxa-9-azaspiro[5.5]undecan-1-one in 20 cm<sup>3</sup> of methanol cooled to -20°C, and the mixture was

then stirred for 24 hours at a temperature in the region of 20°C. The reaction mixture was concentrated to dryness under reduced pressure (2 kPa) at a temperature in the region of 40°C. The residue was taken up in 30 cm<sup>3</sup> of ethyl acetate and 15 cm<sup>3</sup> of water. After addition of 5 g of potassium carbonate and vigorous stirring for 5 minutes, the mixture was allowed to settle and the organic phase was separated out and washed with 3 times 15 cm<sup>3</sup> of aqueous 10% (by weight) sodium chloride solution. After drying over magnesium sulfate and then filtration, the organic solution was concentrated to dryness under reduced pressure (2 kPa) at a temperature in the region of 40°C. 1.12 g of methyl 4-[3-(3-chloro-6-methoxyquinolin-4-yl)-3-(R,S)-hydroxypropyl]-1-[2-(3,5-difluorophenoxy)ethyl]-piperidine-4-carboxylate were obtained in the form of a brown lacquer.

[03757] **Methyl {4-[3-(3-chloro-6-methoxyquinolin-4-yl)propyl]-1-[2-(3,5-difluorophenoxy)ethyl]piperidin-4-yl}acetate**

[03758] A mixture of 0.35 g of methyl {4-[3-(3-chloro-6-methoxyquinolin-4-yl)propyl]piperidin-4-yl}acetate, 0.318 g of 1-(2-bromoethoxy)-3,5-difluorobenzene, 0.15 g of potassium iodide and 0.62 g of potassium carbonate in 20  $\text{cm}^3$  of acetonitrile was stirred for 18 hours at a temperature in the region of  $70^\circ\text{C}$ . After cooling to about  $20^\circ\text{C}$ , the reaction mixture was filtered through a silica cartridge (Bond Elut) and then rinsed with twice 2  $\text{cm}^3$  of acetonitrile. The organic phase was concentrated to dryness under reduced pressure (2.4 kPa) at a temperature in the region of  $45^\circ\text{C}$ .

[03759] The evaporation residue obtained was dissolved in 12  $\text{cm}^3$  of dimethylformamide and then purified by injection

of 4 times 3 cm<sup>3</sup> per chromatography onto an SCX silica gel cartridge (mass 1 g), eluting with a gradient of from pure methanol to a mixture of 4N ammoniacal methanol. The fractions containing the product were combined and then concentrated to dryness under compressed air at a temperature in the region of 45°C. The evaporation residue obtained was taken up in dichloromethane and dried in the open air for 48 hours and then oven-dried under reduced pressure (10 kPa) at a temperature in the region of 50°C. 0.195 g of methyl {4-[3-(3-chloro-6-methoxyquinolin-4-yl)propyl]-1-[2-(3,5-difluorophenoxy)ethyl]piperidin-4-yl}acetate was obtained.

[03761] **Methyl {4-[3-(3-chloro-6-methoxyquinolin-4-yl)propyl]piperidin-4-yl}acetate**

[03762] A mixture of 17 g of *tert*-butyl 4-[3-(3-chloro-6-methoxyquinolin-4-yl)propyl]-4-cyanomethylpiperidine-1-carboxylate in 100 cm<sup>3</sup> of aqueous 12N hydrochloric acid (concentrated to dryness) was gradually brought to a temperature in the region of 100°C with stirring over

18 hours. The reaction mixture was concentrated to dryness under reduced pressure (2 kPa) at a temperature in the region of 60°C.

[03763] The oil obtained was taken up in acetone and the precipitate was filtered off and washed with acetone. 20.4 g of {4-[3-(3-chloro-6-methoxyquinolin-4-yl)propyl]piperidin-4-yl}acetic acid dihydrochloride were obtained in the form of a grayish solid melting at 181°C and becoming sticky. The above product was dissolved in 400 cm<sup>3</sup> of methanol and 10 cm<sup>3</sup> of dry concentrated sulfuric acid, stirred and heated in the region of 100°C for 1.5 hours. The reaction mixture was concentrated to dryness under reduced pressure (2 kPa) at a temperature in the region of 50°C.

[03764] The oil obtained was taken up in 300 cm<sup>3</sup> of water with stirring, neutralized with sodium hydrogen carbonate, basified with potassium carbonate and extracted with ethyl acetate. The organic phase was separated out after settling has taken place, washed with water, dried over magnesium sulfate, filtered and then concentrated to dryness under reduced pressure (2 kPa) at a temperature in the region of 40°C. The aqueous phase was basified to pH 8 with aqueous 5N sodium hydroxide solution and extracted with ethyl acetate, the phases were separated by settling and the organic extracts

were washed, dried with magnesium sulfate and concentrated to dryness according to the conditions described above.

[03765] All the organic evaporation residues were combined and purified by chromatography under a pressure of 50 kPa of argon, on a column of silica gel (particle size 20-43  $\mu$ ; mass 200 g), eluting with a dichloromethane/methanol/aqueous ammonia mixture (40/5/0.5 by volume). The fractions containing the product were combined and concentrated to dryness as under the above conditions. 7.6 g of methyl {4-[3-(3-chloro-6-methoxyquinolin-4-yl)propyl]piperidin-4-yl}acetate were obtained in the form of orange-colored oil.

### Example 31

[03786]     **1-(2-Cyclopentylthioethyl)-4-[3-(3-fluoro-6-methoxyquinolin-4-yl)propyl]piperidine-4-carboxylic acid**

[03787]     A mixture of 0.4 g of ethyl 1-(2-cyclopentylthioethyl)-4-[3-(3-fluoro-6-methoxyquinolin-4-yl)propyl]piperidine-4-carboxylate in 3 cm<sup>3</sup> of dioxane, 3 cm<sup>3</sup> of methanol and 2.4 cm<sup>3</sup> of aqueous 5N sodium hydroxide solution was stirred at a temperature in the region of 70°C for 17 hours. After cooling to about 20°C, the reaction mixture was concentrated to dryness under a pressure gradually reduced from 30 to 2.5 kPa and at a temperature in the region of 45°C.

[03788]     The residue was taken up in 5 cm<sup>3</sup> of a dichloromethane/methanol/aqueous ammonia mixture (40/5/0.5 by volume) and was then purified by chromatography under atmospheric pressure, on a cartridge of silica gel (Bond Elut; particle size 70-200 µ; mass 10 g), eluting with a dichloromethane/methanol/aqueous ammonia mixture (40/5/0.5 by volume) and then with a chloroform/methanol/aqueous ammonia mixture (13/3/0.5). The fractions containing a precipitate were combined, filtered and then washed with methanol. The solid obtained was recrystallized from 15 cm<sup>3</sup> of boiling methanol, cooled, filtered, washed with methanol and oven-dried under reduced pressure (10 Pa) in the region of 20°C.

The filtration liquors were combined and concentrated to dryness under reduced pressure (2 kPa) at a temperature in the region of 40°C. The liquors, once concentrated to dryness, and the solid obtained above were combined to give 0.179 g of 1-(2-cyclopentylthioethyl)-4-[3-(3-fluoro-6-methoxyquinolin-4-yl)propyl]piperidine-4-carboxylic acid in the form of a white solid.

[03789] <sup>1</sup>H NMR Spectrum (400 MHz, (CD<sub>3</sub>)<sub>2</sub>SO-d<sub>6</sub> with addition of a few drops of CF<sub>3</sub>COOD, δ in ppm): 1.41 (mt: 2H); from 1.50 to 1.75 (mt: 8H); from 1.90 to 2.05 (mt: 4H); 2.20 (broad d, J = 14 Hz: 2H); from 2.75 to 2.90 (mt: 4H); from 3.10 to 3.25 (mt: 1H); 3.16 (t, J = 7 Hz: 2H); 3.29 (mt: 2H); 3.50 (broad d, J = 14 Hz: 2H); 3.99 (s: 3H); 7.47 (d, J = 2.5 Hz: 1H); 7.55 (dd, J = 9 and 2.5 Hz: 1H); 8.06 (d, J = 9 Hz: 1H); 8.98 (broad s: 1H).

[03790] **Ethyl 4-[3-(3-fluoro-6-methoxyquinolin-4-yl)propyl]piperidine-4-carboxylate**

[03791] A mixture of 0.5 g of ethyl 4-[3-(3-fluoro-6-methoxyquinolin-4-yl)propyl]piperidine-4-carboxylate, 0.253 g of (2-chloroethylthio)cyclopentane, 0.25 g of potassium iodide and 0.92 g of potassium carbonate in 15 cm<sup>3</sup> of acetonitrile was stirred for 18 hours at a temperature in the region of 70°C. After cooling to about 20°C, the reaction mixture was filtered and then rinsed with twice 3 cm<sup>3</sup> of acetonitrile.

The organic phase was concentrated to dryness under reduced pressure (2.4 kPa) at a temperature in the region of 45°C.

[03792] The evaporation residue obtained was dissolved in a mixture of ethyl acetate/40-60°C petroleum ether (8/2 by volume) and was then purified by chromatography under atmospheric pressure, on a cartridge of silica gel (Bond Elut; particle size 70-200  $\mu$ ; mass 10 g), eluting with a mixture of ethyl acetate/40-60°C petroleum ether (8/2 by volume). Fractions 5 to 14 were combined and then concentrated to dryness under reduced pressure (2 kPa) at a temperature in the region of 40°C. 0.43 g of ethyl 4-[3-(3-fluoro-6-methoxyquinolin-4-yl)propyl]piperidine-4-carboxylate was obtained.

[03793]  $^1\text{H}$  NMR Spectrum (500 MHz,  $(\text{CD}_3)_2\text{SO}-d_6$ ,  $\delta$  in ppm): 0.98 (t,  $J = 7$  Hz: 3H); 1.36 (mt: 4H); from 1.40 to 1.70 (mt: 8H); from 1.80 to 2.00 (mt: 6H); from 2.30 to 2.65 (mt: 6H); 3.02 (mt: 2H); 3.09 (mt: 1H); 3.92 (s: 3H); 3.94 (q,  $J = 7$  Hz: 2H); 7.31 (broad s: 1H); 7.37 (broad d,  $J = 9$  Hz: 1H); 7.94 (d,  $J = 9$  Hz: 1H); 8.66 (broad s: 1H).

[03794] The ethyl 4-[3-(3-fluoro-6-methoxyquinolin-4-yl)propyl]piperidine-4-carboxylate was prepared as described in Example 11.

[03795]     **1-(2-Cyclohexylethyl)-4-[3-(3-fluoro-6-methoxyquinolin-4-yl)propyl]piperidine-4-carboxylic acid**

[03796]     A mixture of 0.2 g of ethyl 1-(2-cyclohexylethyl)-4-[3-(3-fluoro-6-methoxyquinolin-4-yl)propyl]-piperidine-4-carboxylate in 3 cm<sup>3</sup> of dioxane, 3 cm<sup>3</sup> of methanol and 1.2 cm<sup>3</sup> of aqueous 5N sodium hydroxide solution was stirred at a temperature in the region of 70°C for 22 hours. After cooling to about 20°C, the reaction mixture was evaporated under a pressure gradually reduced from 30 kPa to 2.5 kPa and at a temperature in the region of 45°C.

[03797]     The residue was taken up in 5 cm<sup>3</sup> of a dichloromethane/methanol/aqueous ammonia mixture (40/5/0.5 by volume) and was then purified by chromatography under atmospheric pressure, on a cartridge of silica gel (Bond Elut; particle size 70-200 µ; mass 10 g), eluting with a dichloromethane/methanol/aqueous ammonia mixture (40/5/0.5 by volume) and then with a chloroform/methanol/aqueous ammonia mixture (13/3/0.5). The fractions containing the product were combined, concentrated to dryness under reduced pressure (2 kPa) at a temperature in the region of 40°C and dried in a desiccator (10 kPa). 0.14 g of 1-(2-cyclohexylethyl)-4-[3-(3-fluoro-6-methoxyquinolin-4-yl)propyl]piperidine-4-carboxylic acid was obtained in the form of a white solid.

[03798]  $^1\text{H}$  NMR Spectrum (400 MHz,  $(\text{CD}_3)_2\text{SO}-d_6$  with addition of a few drops of  $\text{CF}_3\text{COOD}$ ,  $\delta$  in ppm): from 0.80 to 1.00 (mt: 2H); from 1.05 to 1.35 (mt: 5H); from 1.40 to 1.75 (mt: 12H); 2.19 (broad d,  $J = 14$  Hz: 2H); 2.78 (broad t,  $J = 12.5$  Hz: 2H); 3.07 (mt: 2H); 3.20 (broad t,  $J = 6.5$  Hz: 2H); 3.45 (broad d,  $J = 12.5$  Hz: 2H); 4.00 (s: 3H); 7.52 (d,  $J = 2.5$  Hz: 1H); 7.60 (dd,  $J = 9$  and  $2.5$  Hz: 1H); 8.10 (d,  $J = 9$  Hz: 1H); 9.10 (d,  $J = 2$  Hz: 1H).

[03799] **Ethyl 1-(2-cyclohexylethyl)-4-[3-(3-fluoro-6-methoxyquinolin-4-yl)propyl]piperidine-4-carboxylate**

[03800] A mixture of 0.4 g of ethyl 4-[3-(3-fluoro-6-methoxyquinolin-4-yl)propyl]piperidine-4-carboxylate, 0.245 g of 1-bromo-2-cyclohexylethane, 0.18 g of potassium iodide and 0.737 g of potassium carbonate in  $15\text{ cm}^3$  of acetonitrile was stirred for 18 hours at a temperature in the region of  $70^\circ\text{C}$ . After cooling to about  $20^\circ\text{C}$ , the reaction mixture was concentrated to dryness under reduced pressure (5 kPa) at a temperature in the region of  $40^\circ\text{C}$ .

[03801] The evaporation residue was purified by chromatography under atmospheric pressure, on a cartridge of silica gel (Bond Elut; particle size 70-200  $\mu$ ; mass 12 g), eluting with a mixture of ethyl acetate/ $40-60^\circ\text{C}$  petroleum ether (8/2 by volume). [03830] **1-[2-(2,5-Difluorophenoxy)ethyl]-4-[3-(3-fluoro-6-methoxyquinolin-4-yl)propyl]piperidine-4-carboxylic acid**

[03831] A mixture of 0.38 g of ethyl 1-[2-(2,5-difluorophenoxy)ethyl]-4-[3-(3-fluoro-6-methoxyquinolin-4-yl)propyl]piperidine-4-carboxylate in 3 cm<sup>3</sup> of dioxane, 3 cm<sup>3</sup> of methanol and 2.1 cm<sup>3</sup> of aqueous 5N sodium hydroxide solution was stirred at a temperature in the region of 70°C for 17 hours. After cooling to about 20°C, the reaction

mixture was concentrated to dryness under a pressure gradually reduced from 30 kPa to 2.5 kPa and at a temperature in the region of 45°C.

[03832] The residue was taken up in 5 cm<sup>3</sup> of a dichloromethane/methanol/aqueous ammonia mixture (40/5/0.5 by volume) and was then purified by chromatography under atmospheric pressure, on a cartridge of silica gel (Bond Elut; particle size 70-200 µ; mass 10 g), eluting with a dichloromethane/ methanol/aqueous ammonia mixture (90/9/0.9 by volume) and then with a chloroform/methanol/aqueous ammonia mixture (77.5/19.5/3).

[03833] The fractions containing the product were combined, concentrated to dryness under reduced pressure (2 kPa) at a temperature in the region of 40°C and dried in a desiccator (10 kPa). 0.36 g of 1-[2-(2,5-difluorophenoxy)ethyl]-4-[3-(3-fluoro-6-methoxyquinolin-4-yl)propyl]piperidine-4-carboxylic acid was obtained in the form of a white solid.

[03835] **Ethyl 1-[2-(2,5-difluorophenoxy)ethyl]-4-[3-(3-fluoro-6-methoxyquinolin-4-yl)propyl]piperidine-4-carboxylate**

[03836] A mixture of 0.4 g of ethyl 4-[3-(3-fluoro-6-methoxyquinolin-4-yl)propyl]piperidine-4-carboxylate, 0.30 g of 2-(2-bromoethoxy)-1,4-difluorobenzene, 0.181 g of potassium iodide and 0.74 g of potassium carbonate in 15 cm<sup>3</sup> of acetonitrile was stirred for 18 hours at a temperature in the region of 70°C. After cooling to about 20°C, the reaction mixture was concentrated to dryness under reduced pressure (5 kPa) at a temperature in the region of 40°C.

[03837] The evaporation residue was purified by chromatography under atmospheric pressure, on a cartridge of silica gel (Bond Elut; particle size 70-200  $\mu$ ; mass 12 g), eluting with a mixture of ethyl acetate/40-60°C petroleum ether (8/2 by volume). The fractions containing the product were combined and then concentrated to dryness under reduced pressure (2 kPa) at a temperature in the region of 40°C. 0.4 g of ethyl 1-[2-(2,5-difluorophenoxy)ethyl]-4-[3-(3-fluoro-6-methoxyquinolin-4-yl)propyl]piperidine-4-carboxylate was obtained.

[03838] <sup>1</sup>H NMR Spectrum (500 MHz, (CD<sub>3</sub>)<sub>2</sub>SO-d<sub>6</sub>,  $\delta$  in ppm): 0.97 (t,  $J = 7$  Hz: 3H); 1.36 (broad t,  $J = 11.5$  Hz: 2H); from

[04046]     **Sodium 4-[3-(3-chloro-6-trifluoromethylquinolin-4-yl)propyl]-1-[2-(2,5-difluorophenoxy)ethyl]piperidine-4-carboxylate**

[04047]     Working in a manner analogous to that of Example 1, sodium 4-[3-(3-chloro-6-trifluoromethylquinolin-4-yl)propyl]-1-[2-(2,5-difluorophenoxy)ethyl]piperidine-4-carboxylate was prepared.

[04048]  $^1\text{H}$  NMR Spectrum (300 MHz,  $(\text{CD}_3)_2\text{SO}-d_6$ ,  $\delta$  in ppm):

[04049] 1.09 (very broad t,  $J = 11.5$  Hz: 2H); from 1.40 to 1.70 (mt: 4H); 1.98 (broad d,  $J = 11.5$  Hz: 2H); 2.14 (t,  $J = 10.5$  Hz: 2H); from 2.50 to 2.70 (mt: 4H); 3.22 (broad t,  $J = 7$  Hz: 2H); 4.10 (t,  $J = 5.5$  Hz: 2H); 6.74 (mt: 1H); 7.12 (mt: 1H); 7.23 (mt: 1H); 8.06 (broad d,  $J = 9$  Hz: 1H); 8.26 (d,  $J = 9$  Hz: 1H); 8.26 (d,  $J = 9$  Hz: 1H); 8.54 (broad s: 1H); 9.00 (s: 1H).

[04050] The present invention also relates to pharmaceutical compositions containing at least one heterocyclalkyl-piperidine derivative according to the invention, where appropriate in the form of a salt, in pure form, or in the form of a combination with one or more compatible and pharmaceutically acceptable diluents and/or adjuvants.

[04051] The compositions according to the invention may be used orally, parenterally, topically, rectally, or as aerosols.

[04052] Solid compositions for oral administration which were optionally used include tablets, pills, gel capsules, powders or granules. In these compositions, the active product according to the invention may optionally be mixed with one or more inert diluents or adjuvants, such as sucrose, lactose or starch. These compositions may comprise

substances other than diluents, for example a lubricant such as magnesium stearate or a coating intended for controlled release.

[04053] Liquid compositions for oral administration which may be used include pharmaceutically acceptable solutions, suspensions, emulsions, syrups and elixirs containing inert diluents such as water or liquid paraffin. These compositions may also comprise substances other than diluents, for example wetting, sweetening or flavoring products.

[04054] The compositions for parenteral administration may be sterile solutions or emulsions. Solvents or vehicles which may be used include water, propylene glycol, a polyethylene glycol, plant oils, in particular olive oil, and injectable organic esters, for example ethyl oleate. These compositions may also contain adjuvants, in particular wetting agents, isotonic agents, emulsifiers, dispersants and stabilizers.

[04055] The sterilization may be carried out in several ways, for example using a bacteriological filter, by irradiation or by heating. The compositions may also be prepared in the form of sterile solid compositions which may be dissolved at the time of use in sterile water or any other injectable sterile medium.

[04056] The compositions for topical administration may be, for example, creams, ointments, lotions or aerosols.

[04057] The compositions for rectal administration were suppositories or rectal capsules which contain, besides the active principle, excipients such as cocoa butter, semi-synthetic glycerides or polyethylene glycols.

[04058] The compositions may also be aerosols. For use in the form of liquid aerosols, the compositions may be stable sterile solutions or solid compositions dissolved at the time of use in apyrogenic sterile water, in saline or any other pharmaceutically acceptable vehicle. For use in the form of dry aerosols intended to be inhaled directly, the active principle was finely divided and combined with a water-soluble solid diluent or vehicle with a particle size of from 30 to 80  $\mu\text{m}$ , for example dextran, mannitol or lactose.

[04059] In human therapy, the novel heterocyclylalkyl-piperidine derivatives according to the invention were particularly useful in the treatment of infections of bacterial origin. The doses depend on the desired effect and on the duration of the treatment. The doctor will determine the dosage she or he considers most appropriate as a function of the treatment, depending on the age, weight, degree of infection and other factors specific to the individual to be treated. Generally, the doses were between 750 mg and 3 g of

active product taken 2 or 3 times a day orally or between 400 mg and 1.2 g intravenously for an adult.
